TRAP #1 XBRA chain into ROM. Allan, however, didn't think of this neat possibility - being able to follow the chain was, as far as I know, one of the main reasons for adopting the XBRA standard.

(The same problem occurs with FATSPEED, a freeware (?) GEMDOS speed-up for TOS 1.2; if the programmer of FATSPEED should read this some day, he or she should think of implementing this follow-the-chain-into-ROM-technique into FATSPEED, too. Tnx so much.)

As always, users are forced to do the patching themselves. In this case, I reassembled POOLFIX and inserted a full-blown XBRA algorithm. Apart from that, I optimized the program a bit so that it occupies lesser space in RAM than the previous version. It's also a bit shorter on disk, but since it uses 2 clusters as before, there's no speedup when booting. BTW: I used TURBO ASS for this job, a remarkably fast shareware assembler written by Markus Fritze and Soeren Hellwig, Birkhahnkamp 38, 2000 Norderstedt 1, West Germany.

POOLFIX4, as I called it, has been tested successfully on my MegaST with TOS 1.4 in ROM, on my STE with TOS 1.6 in ROM, and with a 1040 with TOS 1.2 (where it doesn't install itself since TOS 1.2 doesn't need the patch). If there are any incompatibilities with any programs, please tell me:

Claus Brod
Am Felsenkeller 2
8772 Marktheidenfeld
West Germany
(049-)(0)9391-3206

(e-mail: C.BROD@LINK-N (Zerberus net), soon also on FIDO and Usenet)

This program should always be posted or copied with this documentation. I claim no rights on this program (how should I, most of the code is from Allan, who hopefully doesn't mind if I correct him this way), so it's freeware. Spread it. I said: Spread it! Did I say "spread it"? No? So I'll say it again: Spread it!

Sorry, Allan, but I HAD to do this for my readers. I will send ATARI a copy of this program, so that they may be able to use it as an official version (it's clearly better than the original). Let's wait and see if they want it.

>original poolfix info deleted, but will be present in the archive

>program. I have a little shell file. First, it tests for the presence
>of a ".rsc" file is in my current directory. If it isn't there, the
>shell copies it there from its known home, and makes a note of the
>fact. Second, it invokes the program. Finally, when the program
>is done, it refers to the note to see if it copied the ".rsc" file.
>If it did, it removes it.

>This kind of work is necessary when one has the benefit of resource files.
>Do you think I like resource files?

You can also change the environment string PATH to let GEMDOS find
all RSC files in one directory. I do this using the environ.prg
posted some time ago in the auto folder. Works with TOS 1.0, 1.2 and 1.4.

Ron Zuylen writes:

>For now, 6.0.3 is probably the best choice with the Spectre. 6.0.4 works
>great (I use it), but the system always thinks it is running on a
>Macintosh 512KE.

Ummm, that's not my situation here. Mine continually thinks that it
is running as a Plus!!!!! I can toggle back and forth but no change
occurs. Actually, I never noticed the difference until Ron mentioned it
on the net, however, my ST thinks it is a Plus. Weird...
For point of interest, 6.04 includes routines allowing sounds to be
had during window/icon opens and closes, and during trashcan dumps. Really
slick. To access these routines, use SoundMaster 1.4b2 and plug in your
favorite digitized sound. WORKS GREAT!!!! I sure wish we had toys like
for the "ST side".

I think the trick you have to do is to set an environment variable to the shell's name. Then you can shell out in microemacs, as well as use make.
setenv SHELL = e:\msh.prg

> WJOHNSTON@COLGATEU

On the ST end, I would suggest using Uniterm, which includes Kermit, among other protocols. I have been using it on a 1040ST connected to a VAX with VMS 5.2, and have had excellent results with both ASCII and binary files.

As for the VAX - ask your system manager; it may already be installed. If not, there are a number of versions available; the cheapest way is probably via a DECUS tape, which is available for a nominal (for a VAX site) fee. Or he/she may be able to get it from another VAX site locally; there are no restrictions on redistribution.

BTW, I haven't tried Uniterm on a 520 - can someone verify that it works with that HW setup?

Hope this helps.

From: cse0071@uoft02.utoledo.edu
Message-ID: <86.2619bc27@uoft02.utoledo.edu>
Source record: 241882

I was curious if anyone has ever messed with the save game file for
Chaos Strikes Back (.CSB), I know it is somehow compressed but I am not sure
how.
I would like to get into my characters attributes and boost them
somewhat, I don't generally subscribe to cheating but my time to play the game
is very short and not having to keep creating and drinking strength potions
would leave more time for the game.

3233. Lets encourage shareware and crippleware

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 14:28:36 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1528@lzsc.ATT.COM>
Source record: 241956

Here are some additional thoughts on the posting to .binaries. of non-free software.

What seems to have set Steven Grimm off was a submission that stated on the outside that it was being distributed with the purpose of enticing one to buy the product. This he felt was 'bad', 'illegal', 'immoral' or something. This type of product I will call crippleware. Some of it works, some parts are left out.

Yet there abounds Shareware that is identical except for outside statements. Consider Transverter, which, before being included on Spectre Disks was Shareware. Only half of it worked; you get the rest when you pay! Consider SAMBIN.LZH, just found in the binaries. It runs, after blasting you with a screen to pay up, and where to send the money!.

Really, the only difference between a crippleware and shareware submission is a question of how functional the submitted product is. If all it did was put up a glitzy screen, tell you how great it was going to be, and asked for your money, it has little use; and would probably be a waste of bandwidth to transmit. In reality, all these products are much better than this.

Usenet exists as a service to the community. (I hope this isn't also debatable). The better shareware and crippleware will surely end up on GENIE and Compuserve. I am not injured by Steven's stand because I can call these.

However, there seems to be a larger audience, many who are students, that do not or can not afford working accounts on these services. To them, whats in .binaries. is what they get to see, feel, and try. If something good comes along that they can try (for free) and then decide to buy its great.

I hope Steven will reconsider his stand and take a broader view.
The Net isn't being used commercially to pass programs which are usable as is, and thus free. The fact that the Author would like to be paid for writing the program should not be a consideration as to whether the program submitted is disseminated.

From: D.Wade@sysd.salford.ac.UK
Message-ID: <.4.Apr.90.14
Source record: 241864

I am having problems adding an external 5.25" drive to my STE. I have disconnected the 120 ohm pull-up on the drive select and it now just about works. Most disk check programs say the IBM diskettes I stuff in are o.k. However if I try to read files on the diskette sometime I get read errors. I suspect this is due to trying to step too fast. I have tried poking an assortment of values into 440 but these don't seem to change anything. Is there some other way to change the step speed in TOS1.6 or should this work. As Email to our machines often gets eaten my UKC please reply either to the BITNET address or via the net. Thanks.

They're not compressed, they're encrypted. The end result for you or me is the same - you can't make sense of the data as it sits on the disk. I spent a few hours with the crypt breakers workbench trying to make sense of the files, but finally gave up. But I've got a wonderfully reliable way of cheating, still. The data is decrypted in memory, all you need is the appropriate interrupt generator and handler, to doctor up your attributes on demand. I worked it all out using Alpha Systems' SwitchBack. (A marvelously Utile Utility... }-). You need at least 2 meg of memory to use Switchback on Dungeon Master or CSB, 1 to run in and 1 for alternate work. (a debugger, in my case.) I don't remember the offsets right now, but I could pretty easily whip up some code to set all your stats to maximums. (I haven't looked at experience or spellcasting yet, just stats & attributes. food & water is probably a problem still as well.)

It's kind of fun, walking down to level 14 and casting about 100 fireballs in 30 seconds. Dragon steaks, anyone? However, I also discovered that maxed out characters aren't invincible. Lord Chaos can still toast a party in 4 shots if you're stupid enough to let him. (Like I was, while playing around......)

Actually, I guess this method doesn't work unless you have switchback. You can't preserve the exception vectors across a warmboot...

I'm interested that there's a new release. My old version, 1.5 I
believe, had interesting features eventhough being bugged.

My question to the net: does there exist a demo version of SHEET
between my version 1.5 and the new announced 3.0?

Also, how does SHEET compare to OPUS?

As an aside: I saw SHEET, and other shareware, being sold on public
domain disks here in France. Maybe the authors should collect
royalties? :-)

As always, you may reply personally and if there's enough interest
I'll post a summary.

Thanx.

1-you can get an accelerator board for any amiga and use a 68030, Commodore is currently developing UNIX for the Amiga.
2-I dunno!
3-Commodore does for sure, a plan just implemented, about 40% I believe, to any student.
4-does not apply!
5-The Amiga has a custom chip set that takes care of many processor jobs, speeding up programs that have heavy data movement and such. The graphics have 4096 colors, displayable all at once. Don't throw away your software, you can get the Mac emulator. The amiga 3.5 has 880k where the Atari has about half. You can get a hardware emulator for a 286 pc.

> Atari desktop was missing), but they couldn't access the hard disk!

According to Mark Booth (from Genie), some early Stacy models would
cause Spectre GCR to lock up if SCSI LUN 1 was enabled under the
Spectre "Hard Disk --- Devices ..." menu. So, before going into Mac
mode, select "Devices..." under "Hard Disk", and try turning off LUN 1.
(This is the reason Spectre 2.65 defaults to all SCSI LUN1 devices off,
which is a change from the Spectre 2.0 defaults.)

|System: 1040 STf version 1.0 tos (I think) Color Monitor Hard drive
|
|Problem: The computer seems to turn itself off. It's especially bad when I
|first turn it on. I'll be typing, or just sitting there watching it, and it
|will just sortof shut down.(Monitor goes balck, power light goes off) Then if
|I tap the computer, it comes back on. Sometimes it stays on for a long time,
|other times it flickers for a few seconds and then dies again. I thought about
|reseating the chips, but I couldn't figure how to remove the big square ones.
This sounds like a *very* common 1040STf/520STFm problem. That is why I am
posting here instead of only responding by Email.
The Power Supply has a lot of problems with *poor* soldering.
This is especially true on the older style power supplies. The solution is
to open your ST (remove the AC power first, of course) and remove the power
cover and then remove the power supply. Remove the four (4) screws that hold
the power supply circuit board down and gently flip the board over so the
solder side is exposed. Inspect all the solder connections paying particular
attention to area around the center of the board. Using a 25 watt (or so)
soldering iron touch up all questionable connections and be careful not create
any solder bridges (*zap*). If you have *any* doubts about your ability to
do this correctly contact your nearest Atari repair.

Bit fields: Additional Information

In addition to what has been said on this distribution list by
snorkelwacker!usc!cs.utexas.edu!news-server.csri.toronto.edu!torsqnt!tmsoft!mas
net!canremote!david.megginson@tut.cis.ohio-state.edu (DAVID MEGGINSON)
and
rjd@cs.brown.edu
i want to cite from K+R, 2nd edit. (which is based on Draft-proposed ANSI C),
p. 150:

"Almost everything about fields is implementation-dependend. Whether
a field may overlap a word boundary is implementation defined. Fields
need not be named; unnamed fields (a colon and width only) are used
for padding. The special width 0 may be used to force alignment at
the next word boundary.
Fields are assigned left to right on some machines and right to
left on others. This means that although fields are useful for
maintaining internally-defined data structures, the question of which
end comes first has to be carefully considered when picking apart
externally-defined data; programs that depend on such things are not
portable. Fields may be declared only as ints; for portability,
specify signed or unsigned explicitly. They are not arrays, and they
do not have addresses, so the & operator cannot be applied to them."

From: Brian W. Kernighan
Dennis M. Ritchie
THE C PROGRAMMING LANGUAGE
Prentice Hall Software Series
Prentice Hall, Englewood Cliffs, New Jersey (1988)

On the same page it is stated, that "fields behave like small
integers" implying that fields are not greater in size than integers.

(Generally, the portability question rises even if one uses only the
ST, but decides to use different compilers, as has been pointed out
by others. I would like to see portability considerations be taken
into account much more frequently.)

I know this is not a very technical message but
who cares! Need to relax at some point right?

I just bought a new game called MidWinter.
It is a mixture of strategy, adventure, and
adventure. The basic idea is to protect your
island from an invasion force. This takes
place during a new iceage. You have 32 people
you can ultimately control. The objective is
to slow the invasion so you can send a small
group to destroy the enemy headquarters. The
modes of transportation are
skiing
snow buggying
hang gliding
snow lift

All these are from first person perspective
Each person has a sniper rifle, grenades, and
dynamite for sabotage. The enemy is composed
of different snow vehicles.

This is a sweet game. Good to sink into after
work or school.

3245. STe compatibility

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 16:54:20 UTC
From: GHGADMO@BLEKUL11.BITNET
Message-ID: <4Apr1990165702135@BLEKUL11.BITNET>
Source record: 241886

Hi there.

I have a problem concerning the compatibility of the 1040 STe. I tried to run STOS on it, and it results in about (no sure) 4 2 bombs. Any idea why?

Next question: Is there any public domain software on the net which uses the specific abilities of the STe (scrolling, DMA sound,...)

Are there any patches to the TOS?

These are my questions (for now). Hope anyone can answer them.
You can get me at: GHGADMO at BLEKUL11

Kris Van Hees.

3246. Mono monitor blues

Newsgroup: comp.sys.atari.st

3247. 1040ST Ram Expansion

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 17:30:09 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <2778@rodan.acs.syr.edu>
Source record: 241887

I know this has been asked and answered before.
I know this belongs in the "monthly posting"

What is the best way to get a 1040ST to 4meg? I know of the following:

Name	Mail order price I've seen (US $$)
Z-Ram 3-d	$149.95
NEW WORLD UPGRADE	$139.95
ARCO BOARD	$169.95
JRI SIMM Upgrade	$139.95

I believe these are all un-populated boards. I've seen 1Meg SIMMS 80ns for $69.00, I don't know about regular DRAM prices, though. If you have experience with any of these, please tell about it.

What price for board?
What price to populate board?
Is buying an additional 3meg enough, or do I need to buy 4meg for some reason?
How much soldering?
Did it easily fit into your 1040ST?

Is it possible to go beyond 4MB??

Please email. I will of course summarize.

Thanks,
---jb (jfbruno@rodan.acs.syr.edu)

Steve,

Thanks for posting your position on Demos. I happen to agree with you and to feel that you are doing a terrific job and service for all of us, thanks!

As you pointed out the net is NOT FREE. I feel that any posting asking for money should not be allowed, but your interpretation is consistent and works in a positive manner. Disallowing "Shareware" would certainly be a strict interpretation but also consistent.

Yours,
Joe Gilray

3251. PostScript printing from Timeworks

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 17:51:20 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <22881@watdragon.waterloo.edu>
Source record: 241895

I would like to be able to produce PostScript output from Timeworks, upload it to an account with a PostScript laser printer, and print the document from there. However, I have had no luck.

I tried to install Timeworks for PostScript but end up with a missing driver. It seems Timeworks wants to load the driver from the (non-existing) printer. If I tell FontWidth that I have the printer, then it works fine until I try printing, at which point it tells me it couldn't load the driver and the modem lights flash, telling me that it is looking for the printer on the serial port. If I tell FontWidth that I do not have the printer, then it tries to load the driver (from the printer which I just told it didn't exist) right away, rather than when printing.

Can I get it to print PostScript to disk, even though I don't have the printer? Will it work if I can get someone to send me the proper *.wid file? I couldn't find the answers in the manual - maybe I can find them on the net! (Gee, why didn't I get Calamus?)

> (Sounds like someone is more than a bit gullible to pass on
> everything that they heard)

You admit that this is unbelievable and you don't lend any credence to the person who told you. So why post asking for someone to confirm or deny? Just assume that anything you don't hear from several sources is probably false, and things you *do* hear from several sources are probably false, too. Even things from Atari can be false: I said STe's might not have SIMM sockets, but that turned out not to be the case.

All you do by posting this rumor is create more confusion. Some people will believe you, which means people like me have to spend time denying silly things rather than getting useful work done or disseminating useful information.

I know that if I don't go out of my way to deny this rumor (as opposed to discrediting it), people will pounce on me and say, "He didn't deny it!" ... So here goes: To my knowledge, the TT will ship under the Atari name. However, I'm not Jack Tramiel, or even Sam, and my knowledge goes only so far.

To the best of my knowledge there has been never been any commercial software distributed on the net. That would be VERY VERY wrong and Steve has done an outstanding job as moderator. However, a demo is not commercial software, it is simply a demo: A demonstration of capability contributing to the flow of information by adding to the knowledge base of an individual.

The exchange of information, it's what the net is all about.

3255. Splitting comp.sys.atari.st into subgroups

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 20:07:16 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr4.200716.20696@wam.umd.edu>
Source record: 241896

Well, it's come up again. Somone's hinted at breaking this newsgroup into subgroups. This idea hasn't met with much support in the past, but maybe it's time to (once again) reconsider.

I think a division between technical topics, game discussions, and rabid political flames might be nice. Maybe comp.sys.atari.st should split into three groups:

comp.sys.atari_st.general (Games, rumors, questions, etc.)
comp.sys.atari_st.wizards (Technical)
comp.sys.atari_st.politics (Rabid political & financial discussion)

or perhaps

comp.sys.atari_st.religion (Rabid political & financial discussion)

:-) (sorry, couldn't resist).

Things like the monthly "welcome to comp.sys.atari.st" Q & A document would get posted to comp.sys.atari_st.general.

Note that I don't really feel strongly either way about this. It's just a proposal. Feel free to criticize (flame?) or endorse it.

A few questions to ask ourselves:

1) Is there enough newsgroup traffic to warrant this?
2) Will people pay any attention to it, or will everything just get cross-posted?
3) Will it be annoying to have to read 3 groups instead of one?
4) What will happen to info-atari digests?

Comments?

Hopefully, you mean 16 more RAM chips, right? Supposedly one can just solder
16 dip sockets onto the motherboard then fill them up with 1mbit rams, and
the ST will automatically recognize the additional memory. I have been
meaning to try this for a while, but haven't gotten around to doing it yet.
It should work, since the motherboards for the Mega2 and Mega4 are the same.
If someone who knows more about this sees that I am mistaken in some of the
above, feel free to correct anything.

I have the 33D and all I can say is, it is very nice. You need to adjust it very exactly, but once that is done that is it, it offers virtually perfect color and mono, I'd salent, it is LARGER than sm124 yet just as sharp (actually SHARPER in corners in my opinion).

Source record: 241951

TORONTO ATARI USERS CONVENTION : My Impressions

I was one of the attendees in Toronto at the 1990 Canadian Atari Users Convention on Sunday, April 1, 1990 (this past weekend). I came back with several impressions both good and bad of Atari's management and their computers.
My background: I currently own an Atari 8-bit system since 1979 which has seen little use since 1988 when I bought a Commodore Amiga. My best friend owns an Atari ST.

The Atari booth was impressive. Atari had 3 Lynxs running and allowed anybody to try them out with several games that they had there to demo. I was VERY impressed at the quality of the Lynx. Great sounds, graphics, and game playability. The Atari IBM compatibles, Atari STes, Mega STs, etc. were all on display. A business-type approach seemed Atari's plan.

ATARI ADVERTIZING

An hour later, 5 of Atari's representatives talked to an audience of about 200 concerning Atari's plans and goals in the future. Atari's new philosophy is to "TARGET markets for each of our products, and then to go out and advertize SPECIFICALL for those markets". It took Atari FIVE YEARS to recognize this!?!?!?!?
I see several flaws in Atari's plans of segmenting their target audiences. Atari has TOO MANY product lines. The specific markets they are after with which computers:
(a) Atari IBM Compatibles (IBM Market)
(b) Atari STes (Home market/Game market)
(c) Lynx (Game market)
(d) Mega ST (STe?)s (CAD/Business market)
(e) Portfolio (Portable IBM market)
(f) Stacy (Portable ST market)
(g) Atari TT (CAD/higher-end market)
(h) ABAQ/Atari workstation (workstation market)

EIGHT markets for such a small company as Atari is? Look at the main competitiors of Atari and see where they focus:
Nintendo: Focuses strictly on the game market both portable and home game market type, along with Sega and NEC.
Commodore: Main focus is the Commodore Amiga in the home end and multimedia/desktop presentation/graphics end.
Apple: Macintosh with desktop publishing, and the Macintosh II with multimedia.
IBM: Business market

How can Atari afford to have 8 separate divisions of its advertizing dollar? They can't. Atari has to concentrate on one, maybe two places to try and get a market edge in, and only THEN try and expand. Do you see Commodore coming out with many separate lines? No. Commodore is a small company. They have an Amiga 500 for the home, and an Amiga 2000 for higher end work. And new systems like the 2500/3000 are still compatable with the other Amigas and can be advertized along with them. Commodore is thinking about coming out with a game system of their own, ALSO compatable with the Amiga line. Commodore can advertize all their products at once because they can all be the same. Can Atari do this? No. The Lynx, ST, TT, Portfolio, etc. are all different architectures. They all need different advertizing campaigns. Atari has a limited advertizing budget. Atari has, overestimating this a bit, a $10 million advertizing budget per year. Only about $1.5 million can be devoted to any one product. That's not enough. Atari is trying to get into TOO many areas too quickly.
Atari's representatives seemed very unknowledgeable during the conference. Atari did not have any knowledge (as in they never heard of) of the Motorola/Hitachi dispute over the 68030 when asked about it. Atari among all people should keep an eye on this type of news, especially when it might impact the Atari TT - which uses the Motorola 68030 chip.
In my opinion, Atari doesn't have a good grasp over how to handle selling the computers it makes. Atari LOOKS impressive once you go and see their booth and their computers, but if nobody knows about them it's to no avail.

COMPUTER NEWS

The Atari TT was given a release date of late 1990 (as in December).
The Atari TT will be shipping to developers around July or August of this year. No price or even in-the-ballpark estimate of the price of the TT was given.
The Stacy it seems will NOT be an STe, rather an ST. It will NOT have a battery for about a year as it takes too much power to run a hard drive with a portable computer.

Atari has a great line of computers. I was very impressed at the show. If they become aware of how to market them (look how well Apple does with inferior products) and stop developing new models - and support the ones they have made, at least for a few years, Atari will become successful.

- Brandon!

> know I am scanning the net they asked me to ask - is there any trick involved?
> Also - any info how the hard disk is attached in the Stacy? They said it is
> preformatted, prepartitioned, and no human being except High Priests can make
> any kind of changes there. Info?

One or more of the partitions on the STacy hard disk need to be
converted into Spectre partitions. Just use the format command on the
hard disk menu when Spectre is started.

If the Spectre can't access the hard disk at all (ie. not even
from the startup menu) then they need to change the device/subdevice
menu so that the Spectre does NOT access any of the LUN 1 drives, only
LUN 0. After they change the sub-device menu save the Spectre
configuration and then reboot and try again. There is (or at least was)
a bug in the STacy hard disk, if it saw a reference to LUN 1 the drive
locked up. It wouldn't even respond to commands sent to LUN 0.

Message-ID: <1990Apr4.235543.24355@ux1.cso.uiuc.edu>
Source record: 241955
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

Just wondering why all these lame Amiga users are posting and not
many Atari users...

The Amax from what I have heard (that is the Amiga's mac emulator)
is like a tadpole in the pond of mac emulators whereas Spectre on
the Atari approaches the bullfrog.

Atari has the added bonus that many of its users are hacks (like
me) who know much about computers in general. I don't know of
many other computers with as many cheap ways to enhance it. e.g.
The mod to expand the screen to 832x512(about), memory upgrade
without cards... etc.

Dave Small apparently has a 68030 card working for an ST that he
will market...?

The Amiga is also in another price range. (higher)

4096 colours are real pretty, if that's what makes your motor run.

512 are good enough for me.

There is another hardware mod from Germany for the atari that allows
the monochrome monitor to work in the colour resolutions using
grey scales.

Insight: You had a Mac... you'll probably get an Amiga except...
You ditched a Mac... you should get an Atari ST.

3267. Changing Gulam Keyboard

Newsgroup: comp.sys.atari.st
Date: 1990-04-05 01:12:31 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Apr4.201555edt.57940@ugw.utcs.utoronto.ca>
Source record: 241978

Since there have been several inquiries lately on changing the keyboard table in Gulam....

To modify Gulam to suit a particular national keyboard, you could first use a monitor/hex editor program such as ABZMON to search the TOS rom for the keyboard lookup tables, which presumably are correct for that country.

There are three keyboard tables, each 128 bytes long. The first one is for lower case, the second for characters obtained by pressing the SHIFT key, and the third one by actuating CAPS LOCK. In all three cases, the last 13 bytes are zeros. A suitable ASCII search string is '123456789', which occurs in the first and last tables.

Dump the TOS keyboard lookup tables to the printer to have a printed reference, load Gulam as a data file, and search it for its keyboard tables. When you find them, modify them to match the TOS rom tables, and then store the modified Gulam back to disc. The author of Gulam installed his own look up tables for the keypad (so that he could rebind the keypad to other commands) so you shouldn't modify the keypad codes.

I used this method to modify Gulam for the Dvorak keyboard layout. Because the Dvorak layout has the commonly used keys are in the home row, it can be learned in about 3 hours, and it is faster and less fatiguing than the Qwerty keyboard layout. But you do have these layout glitches to solve....
I used the method described above, but with a Dvorak installer program as the reference instead of the TOS ROMs.

Hope this helps:

>kludges that are used to add memory to older STs. SIMMs should be
>very easy to plug in if you are at all handy.

90 days!!! Is that the sort of warranty offers by Atari overseas? Here they offer 12 months. They have to, they wouldn't get away with anything less. 90 days is the sort of limited warranty offered on software. Computer hardware is 12 months minimum. Several Taiwan Trendy-Brand PC Clone importers are offering 24 months. Many have warranty extension schemes (at some cost). I know it is the same in Australia - 12 months, standard.

How can a company say it has any confidence in its product if they don't offer more than a 90 day warranty. I can't believe 90 days is normal - is it some kind of discount offer, shorter warranty, smaller price?

All Atari products are sold here with these incredible double-layer sticker things (which says - remove this, and your problems are your own) which you abosutely cannot remove without breaking, situated over an important screw. It remains intact for the warranty period (12 months) or you don't have a warranty.

>% Furthermore, policy decisions are subject to revision by future policy,
>% so I still maintain it's a bad idea to assume that an STe has SIMMs
>% rather than SIPs.
>
>Memory seems to be the most popular upgrade, and all of your

Absolutely, its one of the first things I hear people ask when they are considering an ST. - "If I buy a 520 now, can I upgrade it to a 1040 later?".

>% Finally, a side note: using SIMMs is not all rosy. The advantages of
>% (dealer-)upgradability must be balanced against the disadvantages

>% inherent in socketed SIMMs. They're less reliable: the sockets break,

>% STe is less reliable than it would have been with soldered-in SIPs,
^^^^^^^^^^^^^^^^
All the installed SIPs I have seen (mainly in PC clones) have been
socketed, obviously not the same type of socket as SIMMs, but the same
idea. Allan still has a point I guess. But what happens if a SIP board
needs replacing and it is soldered in????

A 90 day warranty is typical in the US. Sun offers a standard 90 day warranty, and Apple only recently extended the standard Mac warranty from 90 days to 1 year. Of course, both companies offer extended coverage if you pay extra.

I have a picture in Adobe-2.0 postscript and I tried to import
it into PageStream using the EPS import. It did not work, all
that was left of Mr. Simpson was a square with an x through it.

Does anyone have any idea as to how to get this thing in a format
PageStream or EasyDraw or MacDraw II will understand?

Thanks.

Send email to fdc@watsun.cc.columbia.edu. He wrote Kermit in the first
place and I believe that Columbia has some sort of port for the ST. I
have had excellent luck with the implementation of Kermit on Uniterm,
but some people may prefer getting it from the horse's mouth
(no offense, Frank).

From: tmwhitehead@miavx1.acs.muohio.edu
Message-ID: <1226.261a8959@miavx1.acs.muohio.edu>
Source record: 241973

A friend of mine is running spectre GCR 2.35(I think) with system 6.04
running multifinder on a mega 4. The problem he is having is that he has
trouble reading very long continuous files (600-700k). They work fine up until
the speed change, then he gets a disk error. It reads and writes small files
fine, and it has no trouble formatting disks so that they work on other Macs.

Has anybody else noticed this problem?

Dave?

> Bob

I can imagine that you think the Commodore Amiga is much better than the Atari ST. Fine with me, maybe you are right (could be). But please stay in comp.sys.amiga.

Nice for the Amiga to have a accelerator board, nice to know that Commodore is developing UNIX for the Amiga. Nice to know about some hardware emulator for a 286 PC. Not so nice to know that an ST diskdrive can only format about 440K on a 3,5 inch disk, this is not true (and you know that as well as I do).

But enough of this slagging. The only point I try to make is the following :

If you are an Amiga owner, an Macintosh owner, any computer whatsoever owner, please stay in your own newsgroup, or tell the story from both sides (not a simple I dunno!!). If you don't know than don't try to blacken the other computer.

Dear netters,
today i received some information about the PC-emulator of
Vortex. Seems that is it like PC-Speed but only CGA and Hercules
is possible. In the newest version of PC-speed you can programm the
68000er and a coprocessor will be accepted. The Vortex-emulator has
none of this features. When i have the emulator of omega-systems in
mind i see that there are 16 MHZ possible and i don't know if the
Ram of the Atari is used over 704 KB. Think we have to wait a while
for a emulator with 80286 and 80287 or 80386SX and 80387Sx which
uses full ram, allows to run dos and tos without booting and has full
16 MHZ for all the tuned boards and accepts the 68881. A free card-
slot would be fine two.

I'm using the Timeworks Desktop Publisher for creating docs at home (where I
don't have a postscript printer nor UltraScript (yet)), print them to disk, and
print them at university on the LWII.

As I don't know what kind of set up you have, I'll tell you mine:
Mega ST 4
Megafile 60 - a hard disk seems to be essential for being able to
print to disk, I had no luck installing TW DTP w/o a hard
disk for using postscript *and* printing to disk! The manual
doesn't mention this fact - I had to learn it the hard way!

Hope that'll help you!

I have seen two versions of FS2. The original version was copy protected but
the next version was not. Both versions were loaded at absolute locations
in memory. What this means, is that if the absolute location happens to be
in use by accessories or GEM itself when the program is loaded then anything
(in this case 10 bombs) can happen. Contact SubLogic and see if they have
stopped this dumb practice of absolute location and have a relocatable version
available.

I left my monitor on all the time (I have a vintage 1985 520ST
with SM124 monitor) and never had any problems til last summer
when a lightning storm caused a power surge or something and my
monitor blew its fuse.

I used a screen blanker (can't remember which one and my ST is
across the pond from me).

Your mileage may vary...

> Gerfried

The only docs I know of are found in the book "The Icon Programming Language", although there was an article in Computer Language in late 86 (by the same authors - Sorry, I can't recall the spelling just now, but it's the same folks who put together SNOBOL4....Greenwald? Groenwald? The book should be available in any University library.
... 5 minutes later ...
Oh! I do have the authors' name here - Ralph E. and Madge T. Griswold; no wonder I was screwing up the spelling. The book is published by Prentice-Hall. A pretty good book, paperback so not too expensive - and the language itself is pretty neat.

Hope this helps.

> ^^^^^^^^^^ Bob

What do you mean "Atari has about half." All Atari machines in production come with 720k 3.5 inch drives. These disks are in IBM format and can be exchanged between Atari and IBM and Clones. The Disks can be formatted up to 956K, I believe, but this is unreliable. There are several Mac Emulators for the Atari ST. In my opinion the Best is Spectra GCR by Dave Small of Gadgets by Small. It lets you read and right directly to Mac disks and use a partition of your ST's hard drive as a Mac hard drive. The Mac emulator for the Amiga required that you have access to a real Mac to transfer software over to its non-standard disk format or purchase a real Mac disk drive to attach to the Amiga. Also, as far as I know, the Amiga Mac emulator does not allow you to access your hard drive (this may change). When using the Amiga in 640 x 400 mode, it suffers from interlacing, and the screen flickers. This drives me crazy! This will be corrected when the Extended Chip Set is available, but this also requires a new monitor.
On the ST, you get 640 x 400 resolution in Monochrome (Like on a Mac) with out any flicker, in fact it looks sharper then the Mac's screen and it is bigger. It is also possible to overscan on the ST like the Amiga, this is a very simple modification and I think cost approx $5.
There are also several IBM emulators for the ST. Some are internal modifications and others are plug in boxes that operate concurrently with the ST and let you switch between the two environments. I have heard of one that has a 386 on the board, but I have not seen it yet.

Perhaps because this is comp.sys.amiga? Oh, and I'm glad to know that by virtue of the fact that I use an Amiga I am lame.

> The Amax from what I have heard (that is the Amiga's mac emulator)
> is like a tadpole in the pond of mac emulators whereas Spectre on
> the Atari approaches the bullfrog.

Well, it runs faster than a Mac SE... on a stock Amiga. It's definitely not shabby, and I've _seen_ it run. But I won't say that Spectre isn't any good, because I haven't seen it.

> Atari has the added bonus that many of its users are hacks (like

The Amiga, in the beginning, was owned almost exclusively by hackers. Besides, a stock Amiga can do 768x480 without any hardware mod.

> Dave Small apparently has a 68030 card working for an ST that he
> will market...?

GVP, Ronin, and Commodore _definitely_ already have 68030 cards working for the Amiga that they _have_been_ marketing... GVP has about 5 models, too, including one thats 40 mhz.

> The Amiga is also in another price range. (higher)

You can buy an Atari ST system (computer, monitor, two drives, 1 MB) for less than $1000 dollars?

> 4096 colours are real pretty, if that's what makes your motor run.

So maybe it is and that's why I like my Amiga...

> 512 are good enough for me.

That's your personal preference.

How revolutionary.

> Insight: You had a Mac... you'll probably get an Amiga except...
> You ditched a Mac... you should get an Atari ST.
>
> -- Greg

You _should_ get whatever you feel is the best machine for you. As you may have noticed, I can argue with you all day about which machine is better and neither of us will concede. That's because we _both_ like our machines. If you weren't happy with your machine, you wouldn't argue for it, and I wouldn't argue for my machine if I didn't like mine.

If I were a techo-peasant and had absolutely no idea what to do when I sat down at a computer, I'd get a Mac, simply because its practically guaranteed to be easy to use. That's its strong point. If I wanted to do MIDI, I'd buy an Atari ST. Since I like what the Amiga does for me, that's what I have.

Hi everybody,

I just bought a megafile 30 for my ST and I got stuck into a problem. I'd
like to load TOS.IMG when I boot from the hard disk. Is it possible ?

>it!" ... So here goes: To my knowledge, the TT will ship under the
>Atari name. However, I'm not Jack Tramiel, or even Sam, and my
>knowledge goes only so far.

Yes, Allen, but when....

Some history.

I remember having seen the TT on the Duesseldorf Fair early Sept '89.
When asking about availability the answer was something like
"within three months" or "before christmas"

Somewhere at the end of '89 it was announced on this very network that
the TT would be available 1Q90. I still remember that a fellow reader
got flamed by an atari official because this reader questioned the
availability of the TT. The answer was something like (sorry, I cannot
quote, since I do not save every article I receive):
"We told you that the TT will be available 1Q90. 1Q90 still has six
weeks to go, so there is no reason to flame atari for announcing
vapourware".

Well as you all know 1Q90 came and go, and no TT appeared in the shops.
At Cebit now they tell the system (with tos will be availabe in june or
july (I forgot)).

*** FLAME ON ***

Do you really believe to see a TT this year???? I have seen the TT being
announced about 5 times in the last two or three year by now.
For me the TT is no more or less than a lot of other products announced
by atari (e.g. the modem, the PC addon board etc.). Vapourware.

Why is the system not available. Does an atari official dare to reveal
that?? A single capable EE could have developed this system maybe three
times since it has been announced first. I for me, I lost confidence in
atari a long long time ago....

*** FLAME OFF ***

Ok. back to MINIX.

3287. MIDI at 500KHz ... IT WORKS!!!

Newsgroup: comp.sys.atari.st
Date: 1990-04-05 12:16:56 UTC
From: SA44@liverpool.ac.UK
Message-ID: <9004051235.AA00350@Argus.Stanford.EDU>
Source record: 241959

I read the recent Midi discussion with interest. I too noticed in my ST internals book that the Midi (and the keyboard) ACIAs could be run at 500Khz in stead of the normal MIDI 31250baud. I experimented with this in pure 68000, writing my own MIDI interrupt handlers that were as quick as they possibly could be, as I knew the TOS handlers would be much too slow for the job.
I proceeded to send a copy of one ST's screen over to the others. WIth my interrupt handler bytes were still being dropped.
SO, I changed the code to do away with interrupt routines altogther and wrote a very tight polling routine. THIS DID WORK and sent across a screen correctly.
Of course, this can only be done synchronously and is at the bounds of the 68000's speed, so nothing else AT ALL can be done at the same time as reading the MIDI port. A keyboard interrupt/VBL interrupt will cause the polling loop to drop bytes. 500000 bits per second = 50000 bytes (1 start bit/8 data bits/1 stop bit) which means only 160 clock cycles for the 68000 to get the byte, any delay will be disasterous.
I hope this encourages someone.

>jdroh@athena.mit.edu

Whoa.... There are a whole lot of different Mega 2 motherboards ALONE!!!
Some have the pads for extra RAM chips already, some don't. Some have MMUs
that won't recognize any more memory. And some, a VERY few, came with the
4 megs of DRAMs already, and only needed a new solder connection... (only one
of those has shown up, to my knowledge).

Best thing to do is take your computer to a dealership that you trust, if you
don't feel like finding this out for yourself.

My Mega 2 has the pads for the extra RAM chips. I'm almost willing to bet
money that my MMU won't take it, though... it's a rev. 5.0 motherboard.

I heard something to the effect that this could not be done because
the speed of the Mega 2 chips are slower than that of a Mega 4 and
so the entire 4M would have to be the same speed or better (which I
do not know) in order to keep up with memory refresh.

Did I hear wrong or could I have updated long ago to 4M?

From article <1990Mar24.192858.1655@ns.network.com>, by logajan@ns.network.com (John Logajan):
% From time to time I've seen mention of replacement floppy drives not indicating
% disk change status. Since I've had a replacement drive for longer than my
% human memory works, I don't recall if the original could really detect disk
% change status either.
%
% Looking at the pinouts and schematics for a 520 ST reveals that there is
% no dedicated "disk change" signal. So if the original Atari floppy drives
% could inform of disk change condition, that information would HAVE to be
% indicated in some way over the only lines available to do so, namely:
% read-data, track-0, write-protect, and index. Furthermore, these signals
^^^^^^^^^^^^^^
Write protect is the beasty you want, all you _usually_ have to do is
tie your drive's media change line to the write protect line directly
(a Wire OR). Think about it, on the simplist of 3.5" drives the
write protect is inhibited when something blocks the light from getting
to the sensor, removing your disk allows the write protect line to
toggle. Unfortunately, many drives outsmarted Atari and inhibit the
signal when no disk is in place.

My thanks also to the fellow who pointed out the motor running
condition is due to an upsidedown connector, this is true on late
model STs. You must know which way to plug the drive cable in, it
will go in upside down!

% go directly and only to the floppy controller chip, so that if there is
% any disk-change detection going on, it has to be occuring there.
%
% I will pursue this by looking into the specs of the floppy controller,
% but if anyone has any clues or knows the answer to this, let me know.
% Thanks.

I don't believe this group has the volume to warrant a split. It seems
like the "let's break it up" idea only comes up when seasonal flames
occur -- when they blow over, so does the desire to split. Just my opinion.

Do you have any blank lines in the file? If so, delete them. Even the last line. I had this problem when I first started using Newbell, and it was caused by a blank line at the end. Authors of program like this really should check for obvious things like blank lines, it's not all that difficult.

>year. No price or even in-the-ballpark estimate of the price of the TT was
>given.

Perhaps "last known tentative TT release date" should be part of the periodic "answers to frequently asked questions" post here.

(Anyone remember the earliest date they'd heard for the TT? Seems to me that STart interviewed Jack Tramiel (or was it Sam?) back in '87, and quoted him as saying it was "nearly ready, probably within a few months". I'll have to see if I can dig out the issue and get the exact words. Remember last fall, when Atari cheer-leaders were certain that it couldn't possibly be out any later than spring 1990? Sigh.)

Seems like every company in this industry has its infamous vaporware (Amiga people probably would nominate the "Video Toaster" as their favorite); guess the TT is Atari's. Seems like Atari has become the "boy who cried 'TT'!"

Yes it works with TOS 1.4 !
I use AHDI 3.01 with one MEGAFILE44 with one extra buildin 105MByte SCSI Hard-
Disk. My MEGAFILE-Cardridges are formatted with four Partitions 11-11-11-11.
(512 Bytes per Sector).
The 105MByte Disk is partitioned 27-26-26-26 (1024 Bytes per Sector).

Please use Getbpb() before Rwabs() !!!

While uninformed users are generally quite a pain, I see little need to waste
bandwidth with such an analyzation.

[stuff deleted]

Rather than including a copy of both sets of comments, I would like to request
that people avoid the chance to escalate this 'Flame War' into another set of
numerous useless postings (especially since it would be cross-posted to no
less than THREE Newsgroups).

While Mr. Pepelea makes some interesting (and arguably valid) points, I must
admit that it surprises me to hear an Employee of Commodore stoop to such
things as flaming another Netter. Things come to mind such as "...stooping
to their level...", etc.

As pointed out numerous times, the ST/Amiga/Mac all have supporters/retractors,
and each machine has both strong and weak points. There is no need to once
again debate these various aspects...especially with the intent of starting
a Flame War.

'Nuff said.

I have upgraded my MEGA 2ST to 4MB.
I think it is an good idea to put also a condensator near each RAM between
0 and 5V. The printed-circuit-board is prepared for this.
I also had to add three resistors (33 Ohm).
Those resistors are for the RAS and CAS pins of the second memory bank.

>
>Did I hear wrong or could I have updated long ago to 4M?

Well, I upgraded my Mega2 to 4 megabytes last fall. All you need is
16 1Mbit DRAMs (same speed as those on the board), 16 decoupling capacitors
(same as on the other banks) and 3 resistors (can't remember what value -
look for ones "obviously missing" on the board below and to the left of the
DRAMs). The big pain is getting the solder out of the holes in order to
install everything.

As far as I could tell, all banks are refreshed simultaneously. In any case
I haven't had any problems with going to 4 meg.

3304. monochrome bending & shaking

Newsgroup: comp.sys.atari.st
Date: 1990-04-05 16:59:19 UTC
From: billm@gaudi.CSUFresno.EDU
Message-ID: <1990Apr5.165919.18417@gaudi.CSUFresno.EDU>
Source record: 241998

I don't recall who it was that posted about it, but someone was having problems with slight distortion in the upper left corner, and occasional vibrating of the image on a monochrome monitor.
Most likely this is due to a (relatively)
strong magnetic field near the monitor. I have experienced the same thing myself, when I set a Casio keyboard with built in speakers on top of both of my monitors. (my dorm room is small, and it was the closest place to put it, my MIDI cables are short) When I powered up my system, the color monitor was wild, in fun purples and blues, the mono monitor was badly streched. Needless to say, it didn't take but a moment to realize what it was. Even a stereo speaker hung 2.5 feet above the monitor caused problems (this took longer to realize, but when I swung the speaker, the screen did the hula) As for the screen vibrating, I've found that a color monitor or tv within 5-6 feet of the Atari mono monitor causes a slight, but nonetheless anoying vibration of the screen image. hope this helps.

3306. problems with opus 2.2 (again)

Newsgroup: comp.sys.atari.st
Date: 1990-04-05 17:03:52 UTC
From: Peter_Lawrence_Jackson@MTSG.UBC.CA
Message-ID: <2167540@mtsg.ubc.ca>
Source record: 241930

I am having two problems with the opus spreadsheet 2.2:
1. When I enter a numeric value into a cell, the number is displayed in the cell imediately to the right of the cell in which it is entered. The number is not in that cell (ie it cannot be deleted or overwritten from that cell), but just appears there.

2. I am still having problems printing out charts, I think this is a problem with my assign.sys -- I vaguely remember someone mentioning opus quirkiness here. Could someone email me a copy of an assign.sys that works with opus?

This is my second posting, and I really would appreciate it if someone who has figured out how to use/install the program could reply. If there is interest, I can summarize and post the solution to the net.
Thanks, Peter. (usermeso@mtsg.ubc.ca | usermeso@ubcmtsg.bitnet)

Yes, I think leaving the system on while the monitor is off cannot do
any damage to the system. I didn't switch my ST off for more than 2
years now, and it is still running. The only problem I had was because
I covered the system (a Mega 4) with a cloth to keep the dust away.
That killed the power supply, so I had to buy a 1040 power supply...

Cheers, Frank

This is a nice qualitative statement. I'd be proud had I made it!

> Atari has the added bonus that many of its users are hacks (like
> me) who know much about computers in general.

'Scuse me, but how is this a bonus for Atari?? It's apparent
from this statment that one does not need intelligence to be
a "hack."

>
> Dave Small apparently has a 68030 card working for an ST that he
> will market...?

Big deal. The Amiga has no less than 4 68030 boards (from CBM,
GVP, CSA and Ronin). The GVP boad runs at 40 MHz. These are
available now and have been for a while.

> The Amiga is also in another price range. (higher)

Amiga 500: about $550. How much lower are the ST's?
>
> 4096 colours are real pretty, if that's what makes your motor run.

What if that doesn't make your motor run?? Are they still pretty?

I have written a streaming backup program that talks SCSI to the Adpatec
Streaming Tape interface. The hardware and the program work well for
me.
The next step is to integrated it with Atari's METADOS, if they ever
release it. This would allow access using Fopen, Fread, etc.

This software has been distributed to several people privately.
Send mail, and if the mailers permit I will make it available on a direct
mail basis.

My apologies, indeed I made a mistake. I initially posted my article with the intention of demonstrating how computer wars can be accidentally started if we post messages about other computers when we are uninformed about them. In my attempt to embellish the article I transformed it into another senseless flame.

Now you know that flame wars are created by:

1. People who are uninformed and therefore accidentally start it.
2. People who do not know when to shut up. :-(

> The amiga 3.5 has 880k where the Atari has about half.
> Bob

Well, that's not quite true. Both the early Mac and the early ST supported 1 sided disks, which gave them 400K and 360K, respectively. I don't know enough about each market to know how prevalent those formats are anymore, but I suspect the 800K Mac disks and 720K ST disks are far more common today.

The mechanisms used for each format are different between machines. The ST uses an IBM-type disk controller and give you a format that's physically and logically almost the same as the IBM 3.5" format. Physcially, that's an MFM encoding with 9 sectors/track, 2 heads, and 80 tracks. The Mac uses a GCR format with variable angular density, kind of like a 1990s CBM 1541, to give you 800K per disk. Amiga uses the same MFM encoding as the IBM/ST machines, but it works on a track vs. sector basis. Without requiring any spacing between sectors, the Amiga fits 880K per disk, using 11 [logical] sectors per track, rather than the MS-DOS setup which uses 9. That's why Amigas have no trouble reading MS-DOS or ST 3.5" disks.

3319. Re: PostScript printing from Timeworks

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 00:43:32 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <22944@watdragon.waterloo.edu>
Source record: 241913

Thanks to all who responded to my request on how to print PostScript from Timeworks. Special thanks to the kind soul who gave me the solution that worked! Here is what that solution is (sorry, I already deleted my mail from that person so I can't give credit where it is due):

1. Install Timeworks for a generic PostScript printer.
2. Run fontwid.app, telling it that I have a PostScript printer.
3. Download pscapt.arc from terminator and install it as a desktop accessory. This wonderful program intercepts any PostScript stuff which would be send to the serial port, and sends it to a file. (BONUS: it also works with Microsoft Write!)

Now to print PostScript from Timeworks I do the following:
1. Start up Timeworks and create my document as necessary.
2. Use the pscapt accessory to open my capture file.
3. Print the document
4. Use the pscapt accessory to close the capture file (will close itself if Timeworks exits, but seems to be less picky if I close it myself).
5. Take the disk to the nearest PostScript printer and print it.

It works very well but there are a few comments worthy of mention:

- Microsoft Write checks for the laser as soon as you start the program. Hence you must open the capture file BEFORE starting Microsoft Write. I also found things worked better if I closed that file (after starting Microsoft Write) and then opened a new capture file for my real printing.

- The PostScript file prints fine on a NeXt laser printer. I had some trouble, however, with an Apple LaserWriter (Plus ?). It did not seem to like the "magic word" at the beginning of the PostScript file (something like %!PS-Adobe-1.0 but I'm not entirely sure that is correct). I had to delete that first line then things worked fine on the Apple. (To be honest, I'm not sure that it was the LaserWriter that was the problem. I was printing through an IBM model 30 which was connected to the LaserWriter, along with a number of Macs, via an AppleTalk network. It may have been AppleTalk that didn't like my "magic number" and not the printer itself. Anyway, once I removed the first line everything worked just fine!)

Once again, thanks to all who sent me their help.

3320. Sozobon fix for Gemini

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 00:44:17 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <771@ncs.dnd.ca>
Source record: 241912

To all who have problems running Sozobon-built programs under Gemini.
Do not despair. The real problem is in jas, the Sozobon assembler.
My memory is a little shaky here but after more than a few minutes
investigation I discovered the following:

1. Gemini uses the xArg convention for passing arguments to programs
and Sozobon startup code honours this. Gulam and most other shells do
not make an xArg entry in the environment so certain portions of your
startup code are never executed when calling from those.

2. The section that deals with xArg passing invokes either memcpy or
lmemcpy from dlibs.

3. Although the source for these functions looks ok the jas assembler
generates erroneous code for some bit-oriented instruction (btst?)
therein. Hence your startup code walks into trash of jas' making.

The Solution - either reassemble the memcpy.s and lmemcpy.s functions
with a compatible assembler, or write tiny versions of your own either
in assembler or C, compile them and add them to dlibs replacing the
old versions.

PS - I love both Gemini and Sozobon - add in Gulam and life is fun!

Bob

3321. Let's hear more about Toronto, Please!

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 01:19:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9004060702.AA02226@ucbvax.Berkeley.EDU>
Source record: 241928

The Posting on the Toronto Convention by Brandon Brooks was fine as far as it went, but it would be nice to know more.

1.) How many people came?

2.) Were the 5 guys from Atari all from Atari Canada?

3.) What about some of the seminar topics? The preliminary announcement included one on a hypertext product, which I am keenly interested in.

4.) How many vendors were there? Who were they?

5.) Were there any third-party hardware products of particular interest?

It would be nice to have a post with just the facts, please. No need for an analysis of Atari's market and advertising strategies. These topics get more than enough bandwidth already.

]> UUCP and similar stuff...
Nope. You might be unable to use 16-bit compression on news-batches and
Your might be limited in Filelength, but the software should run with half
a meg.

]On the ST end, I would suggest using Uniterm, which includes Kermit, among
]other protocols. I have been using it on a 1040ST connected to a VAX with
]VMS 5.2, and have had excellent results with both ASCII and binary files.
Yes, UniTerm is a good choice.

]BTW, I haven't tried Uniterm on a 520 - can someone verify that it works
]with that HW setup?
It isn't that big. You won't have big buffers though. So you can't run
the external Zmodem-programs (need at least 96K system-buffer).

Is that the NEC 3D (I have not heard of a '33D')? Which Multisync interface are you using? How must it be adjusted? I am sick of waiting for Atari mono's to make their return!

3326. PC comic book/strip publishing/layout software available?

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 03:28:22 UTC
From: gng@spocom.UUCP
Message-ID: <32@spocom.UUCP>
Source record: 241943
Cross-posted to: rec.arts.comics,comp.sys.ibm.pc,comp.sys.mac,comp.sys.atari.st,comp.sys.amiga

Hi. A very good friend of mine is in the process of producing some comic strips for others and also for her own interests' sake. She is interested in using a computer and a 'comic publishing program' to help her do this work - sort of what a word processor is to writing, or a desktop publishing program is to publishing.

It would be most feasible if there was some sort of program like this for the IBM PC's since she herself already has access to her own PC. But if necessary, she could probably get some other system - Mac, Atari ST, Amiga, whatever...:-)

So, the info. that she would really want is this:

1) Comic publishing programs for the IBM PCs.

2) " " " other computers (Mac, Atari ST, Amiga, etc)

3) Addresses (postal/email), phone #'s of those respective companies that produce this software.

4) Any comic books/strips that are already being published using computers. What sort of software/hardware is used for those comics?

5) Comments, recommendations, suggestions, etc., on the different software or otherwise?

(I myself remember hearing of a program like this on the Mac and a comic book being made on this setup...now if I could only remember!)

Thanks in advance for any help...

Please send replies to me and I'll forward them to her.
Email is preferred instead of a net posting/reply since I don't read these newsgroups very much (with the possible exception of comp.sys.ibm.pc).

I will summarize if I receive a sufficient amount of replies or if a lot of netters request the info. also...

(BTW, Sorry for the large cross-posting....)

Well, I have had no experience with Timeworks, but I can tell you that what you describe works perfectly with Pagestream 1.8. I do all of my rough layout work at home with my cruddy NX-1000, and then print the final draft at school on a NEC laser. To my knowledge, Calamus does not support Postscript, nor is there a conversion utility (I am sure they will come out with one though).

Um, it sounds like you may have forgot to select the 'View Pictures' option.
Pagestream represents all images as a box with an X through it so it can
do fast redraws.

No, actually PageStream can only import PostScript to the extent that it
will dump it to a PostScript printer. Hmm... Fooled again. I'd like
to write a converter since I know the PageStream format if I could
find any PD info on PostScript... anyone?

C-Lab Creator $295
Possibly the best MIDI sequencer package for the
ST. Very comprehensive, but still easy to use.

Drumware K1 Ed/Lib $70
A convenient editor/librarian for the Kawai K1
with a very easy to use graphic interface.

WordPerfect ST $125
The Atari version of the most popular WP package
of them all, with a mouse-based interface.

Why am I selling these? Because I sold my Mega 2. Why did I
sell my Mega 2? Because I need the money for a house...

If you're interested in any of these, please reply to this
message or call me at 408-737-4318 daytime (Pacific) or at
408-984-8619 evenings.

Martin.

3331. HEY!! I NEED Word-Up info!!!

Since I received no reply the last time I posted this, I will modify it
and try again:

OK

I very much need some info on the Word-Up word processor.

1) What are the major differences between Word-Up v2.0 and 3.0, and are they
great enough to warrant the extra $20-30?

2) Will either version run on a 512K STfm with a Single Sided Drive?

A prompt response would be *greatly* appreciated!

Thanks.

HOBBS!

3333. PostScript Printing

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 09:15:00 UTC
From: ivan@cvax.psi.ch
Message-ID: <421
Source record: 241929

Steven Klassen recently mentioned problems printing a file starting %!PS-Adobe.... to a LaserWriter. This may be another manifestation of a problem that bit me once. There seems to be little consensus on just what constitutes a "newline" in a text file (e.g. a PostScript programme) on various systems. I once modified a file on a VAX and got absolutely no output. Turns out that the LPS40 was not "seeing" the newlines as whitespace (explains why the guys who wrote the graphics package always put a blank at the start of each line...), and I had put a % -- i.e. "this line is a comment" on the first line, so the LPS40 just saw one huge (120K) comment! No wonder no output...

If anyone is interested...

Belltest 2.0 is now available at terminator... belltst2.lzh.
Doc follows.

-- Greg

BELLTEST 2.0

by Gregory Mathias Lemperle-Kerr

(for use with NewBell V1.0 by Dan Wilga)

BellTest pops up a dialog box with the options:

1.) FIND .SND - choose the .SND we are working with
it's speed will be shown in the
dialog box... see below. If it is not
within 1-5 it defaults to 3. If none
of the speeds light up... it's a bug...
but a documented one,... so it's a feature.
Select one before playing or else!

2.) 1-5 Select the speed to play at... after I wrote
it, it turns out 5 is the same as 3... Dan?

3.) Speaker Play the sound, saving it's speed for
future NewBell use.

4.) QUIT Quit the Tao Master's program.

NOTES: NEWBELL.PRG is searched for in current directory, then
in C:\AUTO, then in A:\AUTO. If it can't find it, it
will let you know. (It won't work without it).

Have fun...
-- Greg

P.S. an effort is made to save the screen if memory is available.
if not, deal with a messy screen. (Since I don't know
how to redirect output yet. If you know, e-mail to
cs325ec@ux1.cso.uiuc.edu)

VERSION 2.0 UPDATE:

1.) FIND .SND became LOAD .SND.

2.) Slider bar under speeds now adjusts speed in a wide
variety of increments. Center of slider is

normal speed (at load). As the slider moves to
the right, the SND is sped up in proportion to
x^2. As it moves to the left, it is slown
down in the same way. Slider adjustments also
affect the digitized snd file size. To the right,
the file is shrunk, to the left it is expanded.

This could be a great help, disk space and memory
space wise. The .SND files sound as good at most
of the speeds I've tried. So if a sound loads at
2 or 3, put it at one and speed it up with the slider.
If the slider goes all the way to the right and
it is still not fast enough, save it, load it and
the slider will reposition at center.

3.) SAVE .SND: although the 1,2,3,4 & 5 sounds are saved
when you play them (if the slider is at center),
they are not saved when the slider is moved. To
make your changes permanent click here. BE CAREFUL.
****
Slider adjustments do change the file structure!
****

Still PD... I think it's cool though.

-- Greg

P.S. If you slow down a speed with the slider, memory on small
machines (1K or less) may become tight. I don't know,
I have 2.5 meg, but a friend with a 1040 has had no
problems as of yet. You'll be warned if there is a
problem. I had an idiot friend of mine try it out,
so it should be idiot proof now. He caused version
1.0 to crash by attempting to play without loading
prior. :-) That's fixed now. As well as saving.

>1) Get TOS 1.4: it fixes all the problems be re-reading the disk on
> every access.
Are you sure about that? We have several Mega ST4's at work
with TOS1.4, and they definitely appear to have problems distinguishing
when a diskette has been changed. If we change a diskette and
don't explicitly open a window with the A drive and then hit
'ESC' to force it to re-read the disk, we get garbage on file transfers.
It acts like it's reading the first cluster correctly, then goes
off in the weeds, which is exactly what would be expected if the
FAT was wrong.
This is true EVEN though it has re-read the directory! In other
words, you can change diskettes, do a directory and get a correct listing,
but if you try to access one of those files without the above procedure,
you will get garbage.

3337. IBM hard disk controllers to ST DMA - possible?

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 11:43:14 UTC
From: ran@cns.umist.ac.uk
Message-ID: <1990Apr6.114314.4136@cns.umist.ac.uk>
Source record: 241919

Hi!

Has anyone out there managed to connect an IBM-type hard drive to an ST via the DMA port using a modified IBM controller? Everyone seems to go for the DMA->SCSI, SCSI->ST506 route. I generally avoid IBM kit like the plague, but it's a hell of a lot cheaper (typically #40uk for a hard drive controller for an XT, which is a lot less than the cheapest DMA/SCSI board!)

I'm willing to have a bash myself, but first I'd like to know if anyone's already tried it (and with what results), and get pointers to the relevant info (DMA, IBM bus, hard drive data, etc). The DMA port isn't all that difficult to interface to (judging by a logic analyser project in Elektor Electronics last year that used it) and assuming that the IBM end isn't too (ahem) 'esoteric' it should be possible. It would sure reduce the cost of putting a hard disk on by one hell of a lot (and possibly allow the use of other IBM cards...)

bob

Wow, I'm really impressed! It sure didn't look promising at all to me.
How about posting your code to comp.sources.atari.st?

> Of course, this can only be done synchronously and is at the bounds
>of the 68000's speed, so nothing else AT ALL can be done at the same time
>as reading the MIDI port. A keyboard interrupt/VBL interrupt will cause
>the polling loop to drop bytes. 500000 bits per second = 50000 bytes
>(1 start bit/8 data bits/1 stop bit) which means only 160 clock cycles
>for the 68000 to get the byte, any delay will be disasterous.

Dropping bytes could be corrected by transmitting in packets of some fixed
length. (I.e., rewriting the interrupt handler to run as a "block device"
instead of a "character device".) Also, you don't _have_ to send as
fast as the bandwidth allows. You could use timer A to ensure that you
spaced the bytes you sent out to give you 250K baud or 125K baud.

My only fear is that this is machine-dependent. It may be that I
couldn't get this to work because I screwed something up; it may also
be that my rusty old Atari has different hardware than yours... I'm
hoping it's the former. What sort of hardware base did you do this on?

> I hope this encourages someone.

Well, it does, I'm sure. (Me, at least!)

3339. Acc DTA Malloc AES

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 12:48:24 UTC
From: micro@imada.dk
Message-ID: <732@imada.dk>
Source record: 241922

I hope that some of you could help me.

I have 3 problems - no one really, and thats ACC's. No one can
ever have written an ACC without having these problems - and I just
don't want to reenvent the wheel...

First two simple questions :
1) Does 'fsel_input' use 'Fsfirst', 'Fsnext' ?
2) Is there, way to find the size of a file - without
using 'Fsfirst' ?

If the answer is 'NO' to 1) or if 'fsel_input' has a private DTA,
and 'YES' to 2), then please tell me how find the size of a file,
without using low level comands (eg sector read).

The reason is that I don't want my ACC break the current running
program by using or setting the DTA.

If the ACC uses the 'default' DTA, it will write in some
'undefined' memory which might be used by the running program (or an
other ACC). In fact it will use the DTA from the current running
program (Defaults to the comandline!!, in a real program).

It shuld be real easy to do, as the basepage contains an pointer
to the DTA (p_dta), which means that every process can have it's own
DTA. As 'Fsetdta' and 'Fgetdta' are relying on the '*SYSHDR->_run'
pointer, which points to the basepage of the active process, there
should be no problems, BUT '*SYSHDR->_run' never points to the
basepage of an ACC, not even when it is supposed to do it's
initiation!

The second problem - 'Malloc' - yes I guess you know, GEMDOS
allocates memory to an ACC under the name (pointer to the basepage)
of the current running process, which means that the allocated memory
dies with the process. (If this is done to minimize fragmentation, I
say it is a bit drastic!).
Again it appears that all the features are there. As things are
now, ACCs are merly fancy TSR program, and not real processes. If
there was a way of getting '*SYSHDR->_run' to be updated correctly,
it appears that the two problems would be fixed or ???
Also problems with 'Pexec'ing programs from an ACC, could probaly
get fixed too (that is, if ACCs was real processes).

As to Matthew Lodge's experiment with AC_CLOSE, it appears that
EVERY? AES call automatically makes a call to the process switcher.
Try to make an ACC which opens a window, and the AC_CLOSE looking
something like this :

```
case AC_CLOSE:
Cconws("acc closed");
Cconin();
form_alert(1,"[1][|Closed][OK]");
break;
```

Is there anybody who can help me getting the DTA and Malloc working. I would also like to hear about alternative ways to follow.

I am not a developer, and have "The Hichhikers Guide ...", "The GEMDOS Manual", "Pexec cookbook", "Atari ST Profibuch" and "TC v1.1" but none of these fine documents could help me.

I am using a Mega2 with TOS1.4.

Thanks for the time

Klaus Pedersen (micro@imada.dk).

3340. WordUp

> old versions.

An even better solution: fix the sozobon library to use the Atari-standard
ARGV= method of passing parameters in the environment, and persuade
the authors of Gemini to adopt this as well (Gulam and a lot of other
command shells already do). xArgs had some technical merits, but also some
problems (all xArgs programs will break when/if any sort of virtual memory
or swapping becomes available for the ST). Since there's now an official
way of passing extended argument lists, we might as well all use it.

3344. Lynx Easter Egg (Lynx does Mandelbrot and Julia Explorations)

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 15:55:56 UTC
From: U009@CCIW.BITNET
Message-ID: <5A04060A29370275-MTACY830*U009@CCIW>
Source record: 241932

As revealed recently on GEnie, the Lynx game "Chip's Challenge" has a
secret mode. If the password "MAND" is entered, the game changes into
a Mandelbrot and Julia set explorer. While the performance is poor by
mainframe standards, the opening screen giving the largest representation
of the whole region takes about 5 minutes to compute. The joypad posi
positions a 1/4 screen rectangle for zooming in and out by powers of 2.
There is a screen available with the middle option button giving the
current coordinates and zoom factor. The zoom factor seems to have
40 bits of significance, but all the parameters are given in hex inxx
the form XX.XXXXXXXXXXXX to 48 bits.
Arround the boundaries of the zone at high magnifications, the compute
speed is quite acceptable for a kid (like me!). The Option 2 button
will cycle the color look up table CW or CCW for a neat animation.
(Computing ceases while the animation is on.)
I regret that I deleted the original message without noting the name
of the person who found this and therefore can't thank them publicly
here. (It might have been the programmer who wrote it too.)

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

3345. Re: Atari TT

Newsgroup: comp.sys.atari.st

From: calvin.bruner@canremote.uucp
Message-ID: <90040612224786@masnet.uucp>
Source record: 241933

According to Atari Canada at the Toronto Atari show, the TT is to be made available to developers in June, and to the general public in the fall of this year. This is probably the most realistic time frame I have heard, and as it came from the horses mouth, I tend to think that it is a fairly accurate time frame.

3346. Atari UK launches developer support programme!

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 16:40:30 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <2468@syma.sussex.ac.uk>
Source record: 241934

I've just been sent the first edition of Atari UK's new newsletter for developers. It announces their new ProSupport programme. The tone of the announcement is appropriately self-deprecating. An example:

"For those of you reeling from the shock of seeing Atari doing something positive for the developers, there will be a short pause in this the first Atari ProSupport newsletter, while you recover your composure..."

What it all boils down to is that Atari UK have appointed a co-ordinator (Alistair Bodin) to pass on information to developers and answer their queries. Atari will run several conferences on CIX (the UK equivalent of BIX in the USA) and developers can also get in touch by fax, snailmail and telephone.

Developers have to reregister (at no cost) for the programme, and show that they're really producing commercial products for Atari machines (any machine, from the transputer workstation to the Lynx - no separate companies here).

If you want to join, you have to sign a severe confidentiality agreement. As with all such agreements, most of the wording is taken up with the obligations of the developers not to reveal anything said to them. It includes the provision that 'neither party shall publicly announce or disclose the existence of this agreement..', which I find a bit bizarre. The newsletter admits there is a problem about knowing what should be secret, but 'information that seems widely circulated may still be sensitive. Therefore you must assume everything is secret.'

There's lots more about the need for confidentiality, and the dreadful consequences of breaking it, but I don't want to overemphasize this at the expense of the good news about the programme. I hope it becomes a success, and that a better relationship develops between Atari and the UK software-writing community. My only worry is the same one that was aired about the equivalent programme in the USA: the emphasis on people and companies which develop programmes for commercial distribution. I hope it doesn't exclude people who prefer to distribute their programs via shareware or even not charge for them at all. The focus should be on the software, not the distribution method.

Let's hope it works out.

Graham

The STOS version 2.5 upgrade is available from the STOS club library and
presumably Mandarin in England and has been available for several months
(about the time the STe was available in Canada).

Our local store (Kitchener, Ontario, Canada) already has STOS and the compiler
with yellow corner stickers saying ST/STe i.e. Version 2.5 in the box.

I get a bit peeved when the UK magazines still list STOS as incompatible with
the STe.

If you are trying to run a STOS compiled program, ask the author to recompile
with version 2.5.

3348. Re: Splitting comp.sys.atari.st into subgroups

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 18:44:51 UTC
From: forster@cs.umass.edu
Message-ID: <12614@dime.cs.umass.edu>
Source record: 241938

In article <1990Apr4.200716.20696@wam.umd.edu>, dmb@wam.umd.edu (David M. Baggett) writes...
>... Somone's hinted at breaking this newsgroup into subgroups...
>... three groups:
> comp.sys.atari_st.general (Games, rumors, questions, etc.)
> comp.sys.atari_st.wizards (Technical)
> comp.sys.atari_st.politics (Rabid political & financial discussion)

I think a split is a good idea, and I'm certain the group has the volume to warrant it (it fluctuates, but it's easily the largest-volume group I follow), but I'm not sure how it should be split up.
If we used the above scheme, I would (like most people, I suspect) follow both `general' and `wizards' (the latter just on the off-chance that something useful to me would appear, though technical discussions are more likely to be about capturing a triple-shift-right mouse-click using a joystick from GFA Basic). I suspect the volume on `politics' would be nil, because no one is likely to judge their postings to fall in that category (thank Heavens for the `kill' command!). The end result for me would be little change in volume.

If reducing volume individually is the purpose behind the split, maybe someone could gather notes about the range of topics which do and do not interest the readership, and propose a split based on that? My pet hates in topics are: Atari's finances, gripes about how awful the developer support is, Mac/PC/... emulation-specific questions, and hints on how to do things in software I don't own (includes game hints and triple-shift-right mouse-clicks using a joystick from GFA Basic). Obviously, some of these topics can only be dealt with using the kill file, which brings me to another suggestion:
If we had conventions for the subject line (and stuck to them), maybe we'd have more luck with generic kill files. For example, given lines like:
EMULATION: how do I frammitz frimfram on the Spectre?
DEVELOPER: where's the newsletter?
HINTS,GAMES: what to do with the Balrog?
TECH,GFA: capturing triple-shift-right mouse-clicks using a joystick
I could add appropriate generic entries to the kill file, and never worry about the specific subject headings people have used. Of course, I realise there are problems with this, not the least being that people have to stick to the conventions, and that it's not always easy to decide what category something fits in, but at least it's a start.

Source record: 241942

I tried bumping my 520stfm up to 1meg the same way. Solder wick sockets and caps. I socketed and capped. Runs ok. Added DRAM, boots gets verticle lines and bombs. Serious bombs. So badly that it didn't even display them. Tried reboot. No luck. Added some resit ors to the resitor slotss next to the ram. Comes up ok but only recognizes the lower half of memory. I probably fried the chips, but as I don't have a device to test them I am fairly S.O.L. The problem with these upgrades is that there are too many places that might need something new. There are at least three solder-bubble jumpers on the motherboard. There is also room for a blitter. I am going to see if I can diagnose my error, otherwise just go JRI. I figure I can then use the SIMMs in a workstation when it comes time.

You should get STOS Maestro which includes the STOS extension for digitized
sound. I personally bought STOS Maestro Plus which includes the hardware
(sampler cartridge with RCA plug input) but a friend of mine has both
Replay-4 and the software only STOS Maestro and prefers using the STOS
sampler software with the Replay-4 hardware.

A new and improved STOS Maestro 2 should be available within the
next couple of months.

Message-ID: <9004070749.AA27945@ucbvax.Berkeley.EDU>
Source record: 241945

Dear Atarians,
First of all, I am getting a really wierd problem. Every once in a while when I turn my computer on and load either a term program or a WP program, at a random point in time after loading, the sound just dies!!! No keyclick, nobell, no digitized sound, NOTHING! Then, whats weirder, is when I turn the computer off, back on again and load something, the sound returns to normal. Has this ever happened to anyone else? Is something going out in my computer?
Next: are there any english docs on Gemini. I have the Gemini.zoo which released about 27 files. I have done everything I can think of, but I can't get itto work. Perhaps someone could send me a short file describing how to get goingon it, I would appreciate it. If someone could tell me what it is, that would be great. What does it do to the desktop? etc.etc.etc.
Finally, a NeXT will be here on campus in about a week for a demo and I know nothing about it. I would like to know how it stands up to a TT (?) and how the two are similar and different. We already have a price quoted for NeXT:
$13,000+ However, this brings a very nice system (all you could want, right?) to your desk.

You can disable the interrupts quite easily; just mask off the
appropriate bits on the MMU (I think that's the chip; it's one of those)
and all interrupts will be ignored. Or you can re-vector them to short
little routines that increment a counter and return. I'd suggest the
former, because it probably doesn't matter whether the machine keeps
track of, say, mouse movement while data is being transmitted.
BTW, I've had a problem re-enabling interrupts, though; things
keep crashing every now and then.

>If I wanted to do MIDI, I'd buy an Atari ST. Since I like what the Amiga
>does for me, that's what I have.

Considering the fact that a MIDI interface with 1 in, 1 thru and 3 outs can be built for $5-$10, the fact that an ST has one built in, really doesn't mean much...A SUN has a built-in sound digitizer, but considering the fact that it is only 8 bits at a max of 8KHz, it is of little use...Just how many in outs and thrus does a stock 520ST have?

MIDI software is also of little worry here, since Dr. T's makes nearly every title they have for both machines...(my local computer dealer, who does not sell Amiga, told me that Dr. T's is about fed up with the ST because of piracy, and from what I hear, so are many other software vendors...)

>4.) How many vendors were there? Who were they?

Sorry, no facts, no names; just impressions and anecdotes.

It is my impression that there were 20 or 30 booths.

Some ailes were so crowded that it was difficult to move around.

There were swift sales in cheap floppy disks and discounted software.

Now, for some anecdotes:

The first was a conversation I overheard, as I was paying for a purchase. A lady came to the sales booth and asked the price for a certain product. The price was 719, the dealer said. She mentioned that another dealer, from out of town, offered the same product for 699, and would this store match their price? The dealer repeated that his price was 719. The lady turned and went away. Then the dealer said to his co-worker: for 20 dollars, that lady just bought herself a problem, because the first time she has trouble with her product, she will find herself driving 60 miles to get to the other shop.

Some of the booths were software only, with sales direct from the programmer. At least one was software only, but with sales from big name dealer. Some booths had both hardware and software (like stores from Toronto and the surrounding area). A few were manufacturers or wholesalers (such as Atari, one ram board manufacturer, and one was a hard disk sellers). I was interested in this strange category of representatives who had something to show, but nothing to sell (to the public). They only show or demonstrate things and hope that the customer will remember and buy from one of their dealers. I remember one in particular who had a couple of products on his table. He had no name on his product, and no literature about it on the table. I wondered if he had ever taken a course in marketing.

I asked the man behind the table where they were located and did they have a specification sheet or brochure about his product.
He said that they were not selling at that booth, and that we [the poor slobs who had to attend the show] were lucky that they, [the wonderful importer of the product] had come at all. Specifically, he said, "We dinn't have to come here, you know." My mind immediately associated his personality with one of his anatomical orifices.

There were a number of cars with Michigan, NewYork, Pennsylvania and Ohio license plates in the parking lot. I heard customers asking dealers if this product or that had FCC approval. [The answer was yes, because there was some FCC number on the back.] One amusing customer

asked a Canadian sales clerk what the US import duties would be for this fine new monitor that he was just about to buy. The clerk, of course, did not know, but I suspect that in the end, the transaction may have been deemed to have taken place some day in March, and not April first, and that the sales slip may have reflected this.

One dealer who came to the show, but who did not have a booth, told me in casual conversation that he expects, in the near future, to sell only those models of Stacey that have two meg or more. He said that many of his customers had expressed interest in the Stacey, but were disappointed when they saw only a 1 Meg Machine. Apparently he has tried to install memory expansion boards and found it difficult (or impossible?) to fit in. Also, customers wanted hard drives, said he. He expects Stacey with more memory and hard drives to be available in May. We will wait and see.

3355. Programming events question...

Newsgroup: comp.sys.atari.st
Date: 1990-04-06 21:33:03 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1990Apr6.213303.696@sun.soe.clarkson.edu>
Source record: 241949

A friend of mine and I are writing a very simple drawing program
with Mark Williams C.

Our problems aren't in implementing the drawing tools (well, at least
not yet...) at this point. The difficulties we are having are because
we want the menu bar on the screen, and available for use while the
user is using the drawing 'tools' on the rest of the screen.

So, we are using evnt_multi to detect events...

We want an active menu bar, with a blank screen, and be able to detect
menu bar events, as well as detecting EITHER mouse buttons.
We have fumbled our ways though this using the Mark Williams C
example programs on disk and in the book, and gotten these things to
work, but they FREQUENTLY conflict with each other!! For example,
to access the 'drawing tools box' the user clicks the right mouse button,
and it pops up on the screen. Well, if the mouse is in the menu bar with
a menu pulled down, and you press the right mouse button, the tools box
pops up on the screen. Or how about this... When drawing below the
menu bar, and you enter it, strange things happen, like messing up the
bar itself, or worse, it looses track of whether the mouse is on or it is
off, losing it completely.

Obviously we are doing it wrong...
How do we set up evnt_multi (or do we even use it?) to detect either
mouse buttons, stop checking for other things when we are in the
menu bar, and continue checking after we decide we didn't want to invoke
the menu bar in the first place?

Any insights into our problem would be greatly appreciated!!

% ... We have several Mega ST4's at work
% with TOS1.4, and they definitely appear to have problems distinguishing
% when a diskette has been changed. If we change a diskette and
% don't explicitly open a window with the A drive and then hit
% 'ESC' to force it to re-read the disk, we get garbage on file transfers.
% It acts like it's reading the first cluster correctly, then goes
% off in the weeds, which is exactly what would be expected if the
% FAT was wrong.

I think this can happen if you have two or more disks with the same
(internal) serial number. The Atari reads this internal serial
number, and can be fooled into thinking that the floppies are the
same. You can create floppies with the same serial number in at
least two ways:

(1) At least one disk formatter I know of always puts
the same serial number on all disks.

(2) One of my buddies [uh.. make that acquaintances] has a
disk copier that he thinks is just great. It copies the
whole disk, track by track. His "nifty" copier just
happens to also copy the serial number, too. The
result is two floppies with the same serial number.

Of course this might not be your problem, I don't know, but you
might check it out. The lovely utility called VOL will
give you the serial number. VOL was distributed to this news
group some time ago, and is available, I am sure, from some
of the file servers.

3358. Sozobon fix for Gemini

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 00:26:51 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <773@ncs.dnd.ca>
Source record: 241802

To all who have problems running Sozobon-built programs under Gemini.
Do not despair. The real problem is in jas, the Sozobon assembler.
My memory is a little shaky here but after more than a few minutes
investigation I discovered the following:

1. Gemini uses the xArg convention for passing arguments to programs
and Sozobon startup code honours this. Gulam and most other shells do
not make an xArg entry in the environment so certain portions of your
startup code are never executed when calling from those.

2. The section that deals with xArg passing invokes either memcpy or
lmemcpy from dlibs.

3. Although the source for these functions looks ok the jas assembler
generates erroneous code for some bit-oriented instruction (btst?)
therein. Hence your startup code walks into trash of jas' making.

The Solution - either reassemble the memcpy.s and lmemcpy.s functions
with a compatible assembler, or write tiny versions of your own either
in assembler or C, compile them and add them to dlibs replacing the
old versions.

PS - I love both Gemini and Sozobon - add in Gulam and life is fun!

I knew this would happen. What the original poster was referring to
is a convention apparently adopted by some developers in Germany, and
possibly endorsed by Atari Germany. No such "standard" was adopted by
Atari in the US or the parent company, which is why you would not have
heard about it here.

The tone of that posting, even forgiving the fact that English is not
the author's first language, was of a nature that made me reluctant to
reply immediately. I still am.

3362. Digitized Sound Player Available at Terminator (Even More Fun!)

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 01:05:57 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr7.010557.23101@wam.umd.edu>
Source record: 241805

I've posted a program to terminator and to comp.binaries that lets
you play samples at their correct speeds (specifiable in Hz). It
will also run from an AUTO fodler, giving those of you with
Mac envy the ability to play a digitized sound at bootup.

Look in ~atari/music/samples/ for play.arc. (terminator == 35.1.33.8)

Dave Baggett
dmb@cscwam.umd.edu

Sorry, I was talking about the NeXT having a sound digitizer, not a SUN...
I only mentioned it as another example of a computer with a built-in hardware option that lacks the guts many user need, and as a result, they often buy additional hardware anyway, to meet some need that the stock equipment doesn't fit....

Enough said...as has been said before, we all love our machines...I just didn't want an Amiga user to be recommending an ST on an unfounded precedence...

> available now and have been for a while.

The last I heard from GVP, about three weeks ago, they were about to ship
a 33 MHz board Real Soon Now. At this moment you can walk into a store and
buy their 28 Mhz board which uses 25 MHz parts.

Be careful about stating information that is obtained second hand.
Advertizements are not a good source because companies have to submit their
ads long time in advance of the magazines reaching the stores. Thus
discrepancies between their plans and their actual offerings can be arise.

3366. MONOCHROME MONITOR BLUES ADVICE

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 05:36:37 UTC
From: Z4636947@SFAUSTIN.BITNET
Message-ID: <900406.23363577.022791@SFA.CP6>
Source record: 241809

There have been many letters offering advice about the monochrome
monitor problems that I have had. No solution, yet for me but I thought
that I would provide a capture, sans names, of a few of the letters:
=======
I use a Thomson Ultrascan (same as the Mitsubishi Diamond Scan) as both color
and mono. The way to make it sharp enough in mono is to use only the green
gun in mono. At least, that works for me. Probably means wiring around
something in the connector box (mine is homebrew).
=======
Please summarize the replies you get regarding locations for
repair spots and parts for monochrome monitors.
My beloved sm124 monitor is slowly dying (at the moment the white blocks
occasionally get hollow so I can only see the outlines, and I have to give it
a good WHACK on the top of it before it goes back to normal,
but i don't know how much longer I can do this!).
=======
Ask a dealer about monochrome multisyncs. They are what they sound like.
They act like multisyncs but have a sharp mono screen. The plus side
is that they can also act like color monitors, but without the color.
=======
Best Electronics carries all sorts of obscure Atari parts. Call them
and see if they have a flyback transformer.
>>>>>>>>>> capture end

In answer to these, Best doesn't have the particular flyback that is
on my monitor. The monochrome multisyncs seem to be the way to go
and can work as a monochromed color monitor in a tight spot. Also, they
are only about $50.00 more than the Atari monitor and have a larger
screen. I hope to be solving my problem this weekend.

I am sure grateful that the ST is able to go multisync so easily and
cheaply! I looked at the cable diagram and it is simple to configure.
I foresee no problems. Many thanks for those offering to help.

3367. HELP--NeoDesk CLI

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 08:11:31 UTC
From: ehood@ics.uci.edu
Message-ID: <261DA0B2.5316@paris.ics.uci.edu>
Source record: 241810

I recently got NeoDesk CLI with my patched NeoDesk 2.05 update.
The problem is that when I try to press a key when I call CLI the computer
crashes.
CLI is in my NEO_ACC.INF (trashcan.acc). I thought maybe that a
resident program and/or accessory could be conflicting with it. So, I
booted up the system with nothing but NeoDesk and CLI accessory. But it
still crashed.
I have a Mega ST2, MegaFile 30, monochrome and color monitor with
Monitor Master, and a modem. I do not think the AUTO programs I use and
desk accesories are neccessary to put down since I tested CLI without them
(Plus it is around 30 files to type).
Any help would be appreciated.

This problem appeared when I had Quick ST (the graphics accelerator) installed.
Just disable it temporarily/permanently from your AUTO folder. I don't know
if this bug originates in Opus or Quick. Note that the Quick ST I had was the
shareware distribution NOT the commercial version.

>
> 2. I am still having problems printing out charts, I think this is a
> problem with my assign.sys -- I vaguely remember someone mentioning

> that works with opus?

Did you run FONTWID.PRG? I have configured Opus for both a 9-pin Epson
and a 24-pin Epson compatible, so I have *some* experience. I'll mail you
my Opus ASSIGN.SYS file for the 24-pin so as not to waste net space/time.

> This is my second posting, and I really would appreciate it if someone
> who has figured out how to use/install the program could reply. If there
> is interest, I can summarize and post the solution to the net.
> Thanks, Peter. (usermeso@mtsg.ubc.ca | usermeso@ubcmtsg.bitnet)

I have found Opus to be a *very* powerful and useful program. I would suggest
sending in at least $25 to Doug Harrison for the Lotus/Quattro file
compatibility version. The graphing facility is very nice. Opus makes the
aforementioned DOS programs look very primitive.

3369. METAFONT: help, where are the docs?

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 11:11:13 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000041@ux1.cso.uiuc.edu>
Source record: 241812

I downloaded metafont... because in printing Uniterm's tex manual, the dvi previewer says 'cmr17/87pk' not found. So I got cmr17/pk150 and cmr17.fmt from our Unix system and popped them in, but it still gives the same error. Does metafont scale these fonts? No doc was included and man metafont does not show anything on our Unix...

Can someone help me convert 150pk to 87pk (scale it?).

Thanks.

(I know, I'm an idiot, I've never used tex before)

|>
|Perhaps the question here is the line between Moderation and Censoring.
|
|I had thought that Moderated Binaries served to supply:
|1. flow control -- send only so much per day.
|2. eliminate duplication.
|
|Now Censoring as been added. But is it a valid function of the Moderator?
|
|P.S.
|I never distribute thru atari.binaries for just this reason. I don't
|need a self appointed Censor picking through code looking for
|an Offensive line.

Howard, it might not have occurred to you, but I think atari.binaries was not created for the sake of software developers, but for the sake of the users of that software.

1) It gives me a safe feeling to know that someone else (someone I can trust) has taken a look at the code, or the program (whatever applies), before I'm going to use it. Though certainly not foolproof, it makes life harder for 'virus spreaders'.

2) Having a moderator guarantees there is a uniform interface for those wanting to download stuff: the hardware it runs on is mentioned, or the compiler that will compile it (whatever applies). Also the de-/encoding methods will be better standardized.

3) Even developers should benefit from a moderator, given the free gamma-test and possible suggestions for improvement before releasing it to the public. Remember, the net is not for free; having a moderator may well save some traffic.

4) Having a moderator guarantees that certain rules are being obeyed. For instance, source code should be documented. Yes, that makes life harder for developers (at first). And yes, it makes life easier for those wanting to use it. The rule that Usenet should not be used for commercial purposes, should be obeyed by everyone using it; that is, it should go without saying. That is, if you're not obeying it, your system administrator (or a backbone S.A.) is entitled to cancel your

article (the general consensus however seems to be not to cancel but transmit, resulting in some hot flames for the offender; this usually helps). I have no problem whatsoever with refusing commercials.

My $0.04 -

Leo.

3371. WORDUP VERSION 3

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 12:21:56 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID2439.D900407.T092156.CHIASSA@UDEM>
Source record: 241814

I called NEOCEPT last week about version 3 as I hadn't received a mail notice about how to obtain an upgrade. I was told that a) version 3 had not been released yet and b) upgrade notices would be sent out this week. There was an add in STart listing some of the new features in version 3. In brief it will approach some of the features of a DTP package but still keep the wordprocessing flexibility. Fonts and drivers are to be improved as well.

>(It's only about two months old...)
I can't speak for the 124 specifically, but in general, something has happened to your horizontal sync. From your description, it sounds temperature-sensitive. I suspect a bad solder joint, perhaps at the flyback or horizontal-output-transistor (or in those area(s)). Good luck.

>How does one connect the nice NEC 3D monitor so that you can switch
>between mono and colour?

built a switchbox. Basically you just need a 4 pole switch, to switch the RGB lines and mono. There's an article up on GEnie (do a search under multisync) that tells how to do a NEC II, the 3D is the same except it uses the 15-pin VGA plug, which is available from Radio Shack now. Also, I think E.A. Brown now sells a couple of switchboxes that may work with the 3D.

>it went, but it would be nice to know more.
>
>1.) How many people came?

I don't know for sure. It seemed to be less crowded than in November
of 1988, but still, there were a few people. Roughly 2000 by my estimate. I
heard a number of 5000 for November '88, but I don't claim these numbers as
accurate.

>2.) Were the 5 guys from Atari all from Atari Canada?

Denise Carrol, Marketing Coordinator
Howard Rotenberg, Product Support Manager
Geoff Earle, General Manager
Penny Maschio, Sales Administrator
Randy Tjin, Operations Manager
Mohamed Dossani, Financial Controller

I didn't talk to Bob Brodie, but he was there too.

There were also some people from a marketing agency that Atari had
hired, but I didn't meet them either.

>3.) What about some of the seminar topics? The preliminary announcement
> included one on a hypertext product, which I am keenly interested in.

12:00 - 1:00 Meet Atari
1:00 STOS game creation on the ST by Dave Thomas
Hyperlink - Hypertext product from JMG Software
1:30 Quick ST II Branch Always Software

Water Fountain Software Nice& Software Inc
Compuworld Riteway Computers
Intrinsic Software Strata Software
Whats This? Inc Simcoe Computer Centre
Micro D Distributing Saved by Technology
Advantage Computers Gribnif Software
D.A. Brumleve Atari Canada
ISD Marketing

That is the list of exhibitors. But I think one or two of the
small ones have been overlooked. There is one I was at that I cannot find
on the floor map.

>5.) Were there any third-party hardware products of particular interest?

JRI had their Genlock hardware which I had never seen before. I
saw the (I think Supercharger) IBM emulator hooked up to a Stacey. That was
kind of neat. A NEC 5D monitor at the Atari booth. Looked kinda sharp.
A big plotter at the Atari/ISD booth. CD-ROMS; but those aren't 3rd party.

>It would be nice to have a post with just the facts, please. No need
>for an analysis of Atari's market and advertising strategies. These
>topics get more than enough bandwidth already.

I took note of what was said about the TT. Price was not disclosed.
The TT (according the Geoff Earle) is scheduled for pre-production for
developers in June. Full production in the Fall. He said it was a
fantastic product, but long overdue. He said there was no '030 supply
problem at all.

Any more questions? Just ask.
P.S. Much of this info (seminars, exhibitors) is from the promotional
pamphlet that all the stores seemed to have before the show.

3380. 30 New Digitized Sounds at Terminator

Newsgroup: comp.sys.atari.st
Date: 1990-04-07 20:14:04 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr7.201404.10092@wam.umd.edu>
Source record: 241828

I've posted 30 new samples to terminator (35.1.33.8). Most of the new ones I took from the sparcaudio directory at ucsd.edu. The conversion process from Mac->Sparc->ST loses some resolution (due to the way the Sparcs "compress" the samples), so some of the ucsd samples sound crummy when played on an ST. (I only uploaded the ones that sound pretty good.) Most of the new sounds should be played back at the Sparc's standard playback speed of 8000 Hz (not 8192 Hz like it says in the man page, BTW).

Also, for those who haven't heard, there's an arcfile called play.arc in the samples directory (~atari/music/samples) for testing samples and installing them as bootup sounds.

From: kennyz@pawl.rpi.edu
Message-ID: <'0M#VJ=@rpi.edu>
Source record: 241829

I just taught myself Uniterm macros, and I have one major question:

What methods can be used to execute a file with macros in it?

I only know of two so far:
1. Make it an auto-exec macro, which I don't want
2. Define a function key as %macro('filename')

Is there any way to just pass a command to Uniterm, other than the ones
already defined in the HELP menu?

I thought that the company was run by a guy named Finbirg (an alternate
transliteration from Yiddish compared to the more common Germanic Feinberg).
Does anyone know for sure?

You're absolutely right. My bubugged the girl that works the
Gribnif booth in '88 about the meaning in Gribnif, and never got an
answer. Undaunted, he tried again this year, and still got nowhere.
Excepth that the girl told him to watch M*A*S*H to find out. We were
told that this was classified information, and that only 1 person at 1
show came up and knew what Gribnif means. I wonder if it's important.

3387. Toronto Atari Show

Newsgroup: comp.sys.atari.st
Date: 1990-04-08 00:00:28 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Apr7.190324edt.58809@ugw.utcs.utoronto.ca>
Source record: 241823

To me, the most impressive item at the show was the JRI Genlock unit, which Savetech (a local dealer, formerly Electronic Playworld) were demonstrating. The genlock permits a Mega to overlay computer generated graphics on a video signal from a videodisc, television camera or VCR. In this case, they had a Cad-3D demo of a rotating title superimposed on a colour camera image of the crowd, and I was very impressed with the colour quality and stability of the image. The genlock unit, unfortunately, only works with the Mega and is $1100 Cdn from Savetech. You could order it directly from JRI for $750 US, though. As well, JRI are apparently developing a genlock unit for the STE, and I would expect it to cost less since the STE has some capability for genlock built in. (I guess this means the computer clock can be phase locked to an external sync signal such as the 15.7 khz video horizontal frequency. Anyone know anything definite?)

Also, D.A.Brumleve was at the show, displaying several of her programs for kids. My wife bought 'Kidpublisher Professional', which allows a young writer to create stories with pictures. The program is very well thought out, comes with a manual for kids and one for adults too, and our daughter loves it. A real deal at about $30.00. (D.A.Brumleve/P.O.Box 4195/Urbana Ill 61801-8820.)

Also of note: a networked cash register system based on the Atari, that allows the use of bar code wands, a real time video digitizer (image in mono, but claimed to work in colour), a couple of video titling programs, real live Staceys that one could handle, and many Viking moniterm monitors. When I heard about the moniterm, I thought it was simply a magnified monochrome screen, but no, all the icons and window gizmos are the same size, surrounded by *acres* of video real estate. So, for example, you can open a bunch of non overapping directory windows. A very impressive Dynacadd demo was demonstrating on one of these.

The hyperlink 'demo' (one of my main reasons for being there) wasn't done, and so George of JMG Compushoppe in Hamilton simply described what it was going to do when complete. My impression was that this was going to be more of a tool to schlepp data from one application to another, than a compeditor for Hypercard, which is what I had hoped. However, it is encouraging that Hyperlink is to have provision for linking to external modules, so you could connect via your

own driver to external hardware. George will be posting a demo to local BBS's, and I suggested he let me have a copy to look at and I will post impressions here as they develop. (Is emailling a demo to someone specific, in the same category as posting it to a newsgroup?)

Mega 2's were going for about $1000 Cdn at the show, and Mega 4's are still about 2 grand! No wonder there's a lot of interest in upgrading...Sure would be nice to know if the Mega 2 MMU can support 4 megs. Can we tell from serial numbers? Or is there any way for the hardware literate to determine this?

Special kudos to the Toronto Atari Federation for organizing the show-

Peter

> network. It may have been AppleTalk that didn't like my
> "magic number" and not the printer itself. Anyway, once I
> removed the first line everything worked just fine!)

I might be able to tell to why you had trouble with the Apple LP.
You see most PC Postscript files (and perhaps Timeworks DTP) put
an EOT (end of text) character (ASCII 04 I think) at the beginning and
end of the file (To make sure print jobs are separated). However Apple
doesn't and Apple Postscript printers hate them, and won't print files
that contain them. That is probably why when you deleted the first
line it started printing. Anyway, remove the first and last characters
of the file and you should be right.

I have written a text file preprocessor for DTP, and one of its options
is to do just as described above. Unfortunately this version has yet
to be finished for the ST (only the PC version has it at the moment). I
wrote it on contract, but I retain the rights to it, so I will
probably make the ST version postcard-ware when I make it.

(Postcard-ware is a (possibly) new concept of mine - you can use the
software unmodified free, and pass on copies - provided you send me a
postcard, or at least some email. If you don't you can still use it,
but I'll mutter nasty things about you!)

BTW I tried to email this to you (Steven) but it bounced within 10
minutes, so since I thought it might be of general interest, I posted
it. Please send me a reply if I was right, and it will spur me on into
finishing the ST version!

Aaron.

> One other consideration you should have in choosing which
>computer to buy: which one is selling? The Amiga is selling very well,
>and sales are only increasing. Atari has had to continuously drop
>their prices to make their machines sell. Yes, you'll get a cheaper
This is NOT TRUE. Since 1986, when we bought a 1040 w/monitor, the
retail price has gone down $100. The street price seems to have
gone down less. What DID happen that might give you that impression
is that Atari "unbundled" the monitors and consoles, and introduced
the 520STfm (the one with the floppy). "Instantly" the prices of
the machines dropped $175 and $300 (the bundled prices of the monitors)
and the price of the 520+drive configuration dropped because the drive
went from being external to internal.

What I've found surprising is that the price of the ST has basically
NOT DROPPED in four years. If I were Atari, I'd be slashing prices like
mad and attempting to Super VLSI the ST and shrink board space. There
is enough software out there that a real cheap ST could really eat up
some serious Amiga and Apple2GS market share. I'd give up genlock and
all those colors to save real $$ and get some good software.

Meanwhile, Atari is in homeostasis in an industry where growth is imperative!
You need to sell hardware to sell software to make money for authors who
help you sell more hardware...

Ok, I've tried a few little experiments, but I'm still mystified as to how to get my stupid.c file turned into a stupid.acc file. I've tried cc -VGEMACC -o stupid.acc stupid.c just like it says in my MWC manual, even made sure it didn't exit and all. It doesn't use any windows, so I thought it'd be easy. (stupid me) All it does is print numbers to the screen using Bconin. Well, on boot-up it seems to want to run my program - definately not what I intended.

Is there a programming guide for Desk Accessories?

(I'm sure someone has asked this before, but... :-})

Also, I still can't get curses.c to compile with MWC.

IF ANYBODY WITH MWC WHO'SE GOTTEN THIS TO COMPILE IS OUT THERE, PLEASE tell me how you did it.

Thanks!

Dave

I happen to know that guy [Richard] you are talking about - and I believe it was the show in Detroit last summer... Gribnif is actually a character in some fantasy novel, but when Richard told me what it meant, I filed it away in my head under 'useless knowledge which won't come up again' and promptly forgot it. A little note of aside: Dan Wilga was at the booth, and asked Richard what it meant - apparently HE didn't know, and when he found out, he was so grateful that he gave Richard a free copy of Neodesk!!!

>the blitter, there was (on both machines) another chip that more than likely
>has to be installed if you desire the blitter upgrade in. Like I said, I
>don't have the need, so I just never went any farther,

This is to true! There are two versions of the 520STFM that i know about.
One, like the man said, has a blitter socket (which i recomend filling)
but i have no real idea if this mod works and weither you need that
Hitachi chip. (I believe you dont need it but that is from my guess work
not from the man who actual did the upgrade and got it to work.)

There is at least one other version of the 520STFM. One of which i have and
just did the upgrade. Basical, it doesn't have a blitter socket in it.
The upgrade is diffent from that of the above blitter version. Here's my
story: What i found when i opened the case was 6 roms each stating mega TOS
1.2, 16 256k ramchips 120ns with a gap above each for another ram chip.

Just to the left of these were a bank of 33 ohm resisters, a gap, another bank of resistors, 86ohm. NO BLITTER SOCKET!

How i upgraded: Desolder the 16*16 holes put in sockets. (It is the wise thing to do.) Check RAS line to see if connect. I was so i moved on to the CAS lines. Neither CASHIGH nor CASlow (Pin 15 of memory chips) were connected. I searched but found no empty gaps to add resistors to! Trace with multimeter to confirm. CONFIRMED! Add line from MMU pin 22 (dot=1, counter clockwise is next higher pin, side goes from 26 to 10) which is the CAS1high, took a resistor and some wire and ran a lead from it to the high bank of memory (Left side as you type on it). Took a wire from MMU pin 21 (CAS1low) to resistor to low bank of memory (closes to MMU). That is it. (opps... put in memory)
Maybe this will help the original poster.

I hope you mean Bconout. :-)

> Well, on boot-up it seems to want to run my
> program - definately not what I intended.

Yup. That's what it's supposed to do. When the system comes up, it loads the .ACC files and executes them. It's the DA's responsibility to initialize itself, then call the Event Manager to return system control to the AES until it's time to go to work. See below.

There are some other (stupid) restrictions. The desk accessory cannot own file handles or memory; the system thinks they belong to the current program. It also doesn't own the menu bar, so if you want to clear the screen and do generic (vt52) output, you must copy the menu bar manually and restore it manually.

> Is there a programming guide for Desk Accessories?

Maybe for developers, I don't know. I haven't seen the developer documentation. I don't want to have to swear out a blood oath never to tell anyone that Atari exists. (Do you know why you never see lawyers at the beach? The cats keep covering them up with sand....)

> (I'm sure someone has asked this before, but... :-})

Occasionally, but probably not frequently enough for the list of questions that davidli is compiling.

Here is a generic desk accessory skeleton that I posted in this newsgroup in response to a similar question in April 1989. I wrote it for use with Sozobon C, but it should compile under MWC with no problem, except perhaps fullpath(). Sozobon users should note that dastart.o is available by anonymous ftp from terminator.cc.umich.edu.

(I know nothing about your curses problem.)

O/ cut here
=====O\==========

```
/*

3398. Spectrum picture posting:A call to arms!

Newsgroup: comp.sys.atari.st
Date: 1990-04-08 16:43:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9004081735.AA08871@jade.berkeley.edu>
Source record: 241751

OK, I am sure to make some people happy and to forever piss others off.
In that vain, i was wondering if people would like me to post some
spectrum pictures here. Most of you fall into two groups:
1: Don't put that junk here, put it on a a bianaries group of FFT or
something.
Reply #1: Grimm doesn't want them, some people dont have FFT site
access. (One of which it me.) How else do i propagate them?
2: Sure, lets have them.
Reply #2: OK, but i'm not going to put more than a few at a time so you
will have to be watching the group so that none slip by you.

So, it seem i have everything worked out. Not really, I'm pretty sure
that a_slide.prg, the progrm i use to display them which was put out PD.
I just want to confirm it. (A_slide uses a handy dandy .sps extension
the means Smoosh, or 40% smaller than .SPC) So, what i need from you guys
is 1) a reason not to post that acualy is a good reason, or 2)A confirm
of A_slides PD status because i'm not going to reconvert my Spectum pics
to a more bulky format.

I'll decide in one week who wins.

Read in this month's HCC Nieuwsbrief, a Dutch monthly for computer users:

According to Jotka Computing in Ede before long (how long 8-) a 80386 emulator for the Atari ST will become available on the Dutch market. It is a German product, called Delta Modul, that will be delivered together with Dr. Dos. There will be two versions, a 1 Mb one and a 2 Mb one, with prices in the range f 2395,- to f 2849,- (Dutch guilders). Also various supplementary products have been announced, such as RAM extensions till 8 Mb and graphic cards (of which one was said to handle 16.2 million colors).

Leo.

Other possibility is that you ftp it from funic.funet.fi where
I've put the same file available as a .zoo file. Address below.

Hello all,

Could a brave and informed soul comment on if a multisync monitor
can also work on a Macintosh (with an appropriate video card, of course)? If I
get a NEC 3D multisync for my ST, will it also work on a Mac?
Many thanks!!!

Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

Well, I must say, I _completely_ agree ! Couldn't have said it better.

BTW: Do you all know what nice machine you get, if you install OS-9/68k
on your ST... worth a try.

Cheers,
Frank

I bought a game up at the Toronto show and I am stuck already....

The game is called "Future Wars: Time Travellers"
made by Cimematique.
The game takes you through different time peroids and it's really
well done but, I'm stuck!!!!

If anyone has seen or played this game please let me know.

Here's where I am:
In the boss' office and I have found the typewriter and I can't
get out.....I don't know what to do........

Please help or I will have to end my life by hanging myself by
my mouse cord..............

ftp terminator.cc.umich.edu
WHAT WOULD WE DO WITHOUT TERMINATOR?!

Now, I have played it as far as starting a game... it seems to want all of
one meg and will simple crash otherwise... of course, these are personal
experiences and my system configureation changes daily... etc etc.

Good luck! (it is much better than nh2!)

In article <'0M#VJ=@rpi.edu> kennyz@pawl.rpi.edu (Kenny Zalewski) writes:
%I just taught myself Uniterm macros, and I have one major question:
%
%What methods can be used to execute a file with macros in it?
%
%I only know of two so far:
% 1. Make it an auto-exec macro, which I don't want
% 2. Define a function key as %macro('filename')
%
%Is there any way to just pass a command to Uniterm, other than the ones
%already defined in the HELP menu?

Nope, that's about it. The obvious refinement is to define a function key
that prompts for the name of a macro file to execute, and executes it.
I suppose you should also be able to define a slot in the popup menu for it.

Actually it's a compressed tar file, not a shar file. It's also on terminator in the telecomm directory. The compressed tar file is there, as well as an arc file containing just the program and resource files. (The resource file hasn't changed since the previous edits...) There is also a uniterm subdirectory containing the uncompressed contents of the tar file.

That is TAR'd, I believe, not SHAR'd. I put the file at terminator,
I think it is now located in telecomm/. I got STTAR and uncompress.ttp
(oops, compress.ttp) from ??.fi. and uncompressed it on the
Atari side.

Could you (or anyone) please email me a copy of the a_slide
distribution? I want to add this format to the picture formats list.

Thanks,

Dave Baggett
dmb@cscwam.umd.edu

3414. PD is not sacred (IMPORTANT -- PLEASE read)

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 04:39:11 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr9.043911.26046@wam.umd.edu>
Source record: 241757

A certain magazine which will go unnamed (for now) has printed a version
of the picture formats list nearly verbatim, and this magazine's editorial
staff has taken credit for the compilation and editing of this information.
The editor and many contributors were not given any credit.

It would be irresponsible of me (and probably pointless) to divulge the
name of the publication at this time. There is still the possibility
that an unfortunate error was made and I do not want to malign the
magazine or its staff.

In any case, everyone who is interested in distributing information and/or
software for free should be aware:

There are unethical and/or incompetent people in the world.

Shareware authors: ALWAYS put a copyright notice and a distribution policy
on everything you release. Although these are not legally binding, they
make your intentions clear and will deter individuals of various sorts
from plagiarizing and/or stealing your work. Such contractual statements
can (in theory) make a difference in court as well. (So I am told.)

I have added some legal/contractual stuff to the header of the picture
formats list and humbly request that those of you who have found this
information useful actively seek out and replace old copies of the list
with this new version. Perhaps then the following people will be given
credit in the future for their help in making this document as
popular as it has become:

Phil Blanchfield Jason Blochowiak David Brooks Neil Forsyth

Stefan Hoehn Ken MacLeod Jim McCabe Darek Mihocka David Mumper

George Seto Joe Smith Greg Wageman Roland Waldi Gerry Wheeler

I know old copies exist at terminator and at other FTP sites. Please
get rid of these old versions. It will be _much_ appreciated. Ditto
for the online services (which I unfortunately don't have access too).

The new list is enclosed.

Thanks all,

Dave Baggett

MacPaint

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0
```

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (usually " . ")
1 byte unused (?) (usually either 80 hex or 0)
1 byte color animation limits (4 most significant bits are
left/lower limit; 4 least significant bits are
right/upper limit).
1 byte color animation enabled? High bit set if yes.
1 byte color animation speed and direction
x = 0 means animation stopped
x < 0 means colors cycle to the left (decreasing)
x > 0 means colors cycle to the right (ascending)
Number of vblanks between cycles is |x| - 1
19 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)

*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (not used)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the highest
order bit plane of scan line zero, followed by the data for the next lower
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the highest order bit plane of scan line one, followed by the data for
the next lower order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed
in this buffer.

o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that
do not follow the standard format, so let's be careful out there. What
is described here is the format that David Mumper's original
TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)> *.SPC

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).
Yes, it is hideously complex.

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)

1 word line width in pixels
1 word number of lines
-------
```

16 bytes total for header

? bytes data

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 word unused (?) [255]
1 word number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes (?) to use
literally. The literal data bytes follow.

otherwise Monochrome run. The value of x determines
what to draw. The high bit specifies the color.
The low 7 bits, taken as an unsigned quantity,
specify the length of the run (the number
of pixels to draw).

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

```
<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;
```

```
Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM"
8 bytes form chunk: 1 long = length (8)
4 bytes = ID ("ILBM")
4 bytes "BMHD"
20 bytes BMHD chunk: 1 long = length (20)
(BitMap 1 word = x width (pixel)
HeaDer) 1 word = y height (pixel)
1 word = x-offset (pixel)
1 word = y-offset (pixel)
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent,
3=lasso)
1 byte = compressed (1) or expanded (0)
1 byte = 0
1 word = transparent color (for mask=2)
1 byte = x-aspect
1 byte = y-aspect
1 word = page width
1 word = page height
4 bytes "CMAP"
3n+8 bytes CMAP chunk: 1 long = length (3n + 8 for n colors)
(Color 3 words = R,G,B color 0
MAP) ...
```

```
3 words = R,G,B color n
4 bytes "CRNG"
8 bytes CRNG chunk: 1 long = length (8)
(Color 1 word = 0
RaNGe) 1 word = animation speed
1 word = active (1) or inactive (0)
4 bytes "BODY"
? bytes body chunk: picture expanded/compressed

Format of body data

An expanded picture is simply a bitmap. The compressed data consists
of records of single control bytes followed by data.

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 1 times

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

Note:
The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Animation speed of 16384 means 1 full rotation in 1/60's of a second.

<MacPaint>

Word has it that this is wrong. Someone please send me an accurate
description!

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
83 longs reserved
} (total 160 longwords for header)
< 51200 bytes compressed bitmap data
-------------
```

< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

> will have to be watching the group so that none slip by you.

Whoa!

Dumping digitized pictures into ANY of the comp.sys.* newsgroups is way
out of line. They're for discussions, not for large quantities of
binaries, source code, or pictures.

If you think there's demand for digitized graphics, fine -- go through the
same process everybody else has to go through.

Start off with a mailing list. Advertise its existence. Accept the
responsibility for maintaining it.

Once it has grown to a level that demonstrates a high level of interest in
the data, propose adding a Usenet newsgroup devoted to it. Go through the
standard process of announcing the proposal, soliciting comment, calling
for votes, collecting, counting and posting the votes. And live by the
outcome.

Yeah, it's a lot of work. So is moving the data around. Until you invest
your time and your effort in meeting the established requirements for
newsgroup creation, don't ask other people to pay the bill for shipping
digitized images around the world.

> So, what i need from you guys
> is 1) a reason not to post that acualy is a good reason,

Digitized images are not within the charter of comp.sys.atari.st. That is
reason enough. If you don't find that persuasive, look into your wallet
and consider whether you're willing to pay to have the data delivered to
those sites that receive Usenet news through long-distance telephone

connections.

> or 2)A confirm
> of A_slides PD status because i'm not going to reconvert my Spectum pics
> to a more bulky format.

I have no opinion on that question.

> I'll decide in one week who wins.

You don't have the right to make that decision.

The process whereby such decisions are made is well-documented in articles that are posted periodically to news.announce.newusers and other groups in the news hierarchy. You should read those articles before posting any digitized images.

I'm not against the distribution of the images. If the load is held to a reasonable level, I might even consider carrying them here. But what you are suggesting is not the way to do it.

3417. Portfolio 640k

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 07:42:18 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <2853@sactoh0.UUCP>
Source record: 241764

About the Portfolio, it mentions that it is expandable to 640k, but nowhere in the manual does it say how. (This is printed on the outside of the box)

So how will the Portfolio be expanded? Will the additional memory be added through the system bus? Will there be either higher capacity cards? Would there be a market for a card drive for the ST, like there is for the IBM?

Data transfers through the parallel interface is simpler than the serial interface. I recommend it over the serial *if* you have a PC. For STs and anything else (your 600XL maybe?) use the serial interface and make a cable.

I really like the Portfolio, I can run small programs, but I use the editor more than anything else. And of course, anyone who sees my use it is intrigued by it to ask me about it.

3418. Atari Japan

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 08:11:36 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <2856@sactoh0.UUCP>
Source record: 241763

I had read in comp.sci.japan that Commodore Japan closed it's doors, and it got me to thinking, how is Atari Japan doing? I have seen an article about the Atari Lynx in a Japanese magazine, but that's all I have seen about Atari in Japan.

The question, is there a Japanese OS for Japanese STs (if they exist there)? For example, there is KanjiTalk for Apple Macintosh. and a Japanese OS for IBM machines, and I'd be interested if there was one for the ST, without having to do it through emulation.

By the way, does anyone know of any comments about the name Atari in Japan? It was chosen from a move in the game Go, but atari (lower case) has a few other meanings in Japanese, also.

3419. Help needed with GEM metafiles

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 11:19:14 UTC
From: tikkanen@kannel.lut.fi
Message-ID: <1935@kannel.lut.fi>
Source record: 241762

What is the right structure for GEM-metafile?

In my Mark Williams C(v2.xx) manual there is one structure, but it
seemed not to be the same that for example MS-write and
gemini-clipboard use.

Could some please post the right structure! Specially i need the
header structure.

BTW.: Gemini v1.0 clipboard behaves strangely when you open
metafile file in it. It prints the metafiles to printer right,
but on the screen not so right. Is this bug in clipboard.acc
programm or in TOS 1.4. I have a old 520STF with TOS1.4, the meta-
files i have used are from MS-write 1.0.

3420. My experiences with PC-Ditto II

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 12:58:13 UTC
From: romwa@gpu.utcs.utoronto.ca
Message-ID: <1990Apr9.125813.635@gpu.utcs.utoronto.ca>
Source record: 241766

After some fanangling I have PC-DITTO working. There is still the odd glitch, but overall I am pleased with it.

THE SETUP:

1040ST (circa 1987) with no mods + mono monitor.

When I first installed PC-DITTO it complained a lot about things not being setup up correctly. This turned out to be the now infamous connector which clips onto the CPU. You have to bend in all the pins to give it a snug fit. I also ran into the PAL problem which Avant-Garde fixed quickly with a couple of new PAL's.

This weekend I was reviewing IBM's Current and Richmond Technologies' Maximizer for a Canadian rag, both of which ran without a hitch. Current is painful to use not because of speed but rather because of PC-DITTO's limitation to CGA video. I hope they can come out with at least an EGA version quickly. I also run Harvard Project Manager regularly on PC-DITTO. Text based applications should not have too many problems. I also had to use Procomm to do a dial out session (which was torturous hell after having used Uniterm for so many years).

This weekend I happened to notice a new phenomenon: During the first 15 minutes of use I can sometimes hang PC-DITTO. I suspect that this has to do with the connector/cpu heating up and expanding. I am not thrilled about this precarious set up, but I am also not keen on soldering the connector on. Any suggestions on how to fix this would be appreciated.

Oh and another thing I would advise you not to try to stuff everything back into your case. I did (minus the RF shield) and ended up putting a crack in my keyboard PC board. Thanks to Peter Hiscocks for fixing this for me. (Don't every let a software person try to do something mechanical!) Now I just leave everything open with PC-DITTO hangin off the back end of the system.

Bottom line is that it seems to be stable barring the cpu connector. I'd like to be able to turn on the machine and start working with it immediately rather than wait for heat expansion to take its course.

Cheers!

...I wouldn't leave monitors on all the time, screen saver or no
screen saver. The constant heat from the power supply etc will
eventually dry out the electrolytic capacitors. It happens quite
regularly with other makes (such as our Phillips-made Apollo 19" mono
jobs)

Capacitors being capacitors, however, you never know if/when...

3422. trouble with MT C Shell

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 14:17:41 UTC
From: rjd@cs.brown.edu
Message-ID: <35708@brunix.UUCP>
Source record: 241765

I just bought a used version of MT C Shell v 1.1. I am having
a bit of trouble that I was hoping someone could help me
out with.

I configure the \etc\ttys file for the modem by doing a
17tty1:
The result is that when I turn on MT C Shell by doing a
INIT2.PRG, the send-receive lights on the modem go
nuts, and the hard drive starts accessing like crazy.
(I think MT's version of "getty" is freaking out.) When I
turn the modem off, this thing settles down and initializes, but
then I cannot dial in to the system. My modem answers the phone, but
does not emit a carrier tone.

Any answers out there?

This is running on a 1 Meg system, which the manual implies is
just fine. I hope that you are not going to tell me that I need a
memory upgrade.

Its kinda important that I get this working, since this is the
purpose that I bought the shell for in the first place.
SO, if this doesn't work, I am gonn ahave to get a memory
upgrade and get MINIX.

3423. Suggestions for monthly posting

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 15:44:34 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Apr9.154434.27366@chinet.chi.il.us>
Source record: 241776

I tried to mail this, but it bounced, and bounced, and.....

A few things I'd include in a monthly posting:

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

>will cycle the color look up table CW or CCW for a neat animation.
>(Computing ceases while the animation is on.)

Wrong. The color cycling is one of the many built in graphics functions and
does not stop the computation nor even slow it down! After hiting option2
it stops, you can then hit option1 to continue redering while it cycles. If
you hit option2 again it will reverse direction, a third time will stop it.

If there is any pause of about 15sec. the Lynx will automatically start
generating again, with or without the cycle on. You can also pick from
13 color palettes, and very the speed of the cycle.

3425. FAT problems (was: problems with dutch ROMs)

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 16:49:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9004100704.AA10323@ucbvax.Berkeley.EDU>
Source record: 241787

What I found out about the FAT problems up to now.

Problems are known to occur in at least 3 machines. All of them after
TOS 1.4 was installed. (One machine had not been used with old ROMs).
In 2 cases the ROMs were dutch, in one case US.

The symptoms are: - lost and cross-linked clusters on the harddisk.
- FAT comparison from dlii or SED (diskeditor from
the german `kleisterscheibe' do not give
reproducible results. (I.e. the FATs are indicated
to be different SOMETIMES).

I think wrong reading of the FAT would be enough to explain the problem.
But why are the FATs read wrong?

Problems stop if harddisk is used with another ST (with TOS 1.2). Thus the
problem is not caused by an error in the harddisk itself.

Harddisks all were original atari disks. Formatted with HDX and used
with AHDI in 2 cases (don't know what version), partitioned with
SED and used with CBHD in 1 case. The problem does not seem to
be related with any program used.

It was suggested that a weak driver chip could cause the problem.
I did forward the idea to my dealer, he does say he installed the ROMs as
Atari told him to (I don't know whether that means that these chips are
changed). Could such a chip really cause the problems indicated here?

I did test the ROMs as far as possible. I wrote a little program that
reads the ROMs 1000 times and compares the results with what it finds the
first time. No errors. Thus reading of the ROMs seems to be reproducible.
(This program also calculates a checksum. I would be happy to send it
to anyone. I would like to know the checksum somebody else finds with dutch
ROMs).

Up to now nobody has told me he is using dutch ROMs without problems
(which does NOT mean that they are bad, just that they can be bad).

It would be nice if some people would want to test dlii's disk check
repeatedly. I would like to know whether the problem with sometimes (say 1 in
5-10 checks) wrong FAT reads occurs with others to. Do not use a cache program
if you test this. The FATs should really be read again.

3427. File Transfer Protocols wanted

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 19:24:51 UTC
From: ajy2208@ultb.isc.rit.edu
Message-ID: <2730@ultb.isc.rit.edu>
Source record: 241760

Hiya everyone,

I am looking for sources/descriptions for any file transfer protocols
I can get my hands on. These include: Xmodem Checksum (blech!),
Xmodem CRC, Xmodem 1K, Ymodem Batch, Fmodem, Zmodem, and any others
I may have left out (either intentionally (kermit) or not)..

I'd prefer C source, but beggers can't be choosy. :-) I don't
imagine there is public domain source for all of these, so any
implementation descriptions will be just as useful as the actual
source code.

Many thanks in advance,

3428. MX2NET Problems

Newsgroup: comp.sys.atari.st
Date: 1990-04-09 19:33:06 UTC
From: ajy2208@ultb.isc.rit.edu
Message-ID: <2731@ultb.isc.rit.edu>
Source record: 241761

A friend and I recently tried to get MX2NET20 to work without success. This is a collection of programs that allow you to access a remote computer's drive locally through the MIDI or RS232 ports.

We tried everything imaginable but were unable to get ANYTHING transfered between the computers. We were using the MIDI ports at first and then tried the RS232 ports at 19,200 and 9600 baud. No luck. The only thing we DID manage to do is make the computers BEEP when we ran the MX2NET program.. sigh..

We were using a mono 1040ST and a colour Mega ST. Before anyone asks, the MIDI cables were hooked up correctly, and my null modem connector works beautifully (we verified this with a terminal program).

I know there are several commercial networks out there (SGS and Lantech come to mind), but I don't want to spend gobs and gobs of money just to network two computers.

The reason I'd like this to work is that we are working on a big project and would like to have the source files stored on one place. Does anyone know if RCS (revision control system) is available in one form or another for the ST? ?? ?

oh yes, I got MX2NET20 from terminator.cc.umich.edu.

thanks for any help ,

> char path[128], defult[13] = '\0';

My version of Sozobon C would not compile this unless I changed 'char' to
'static char'. This agrees with what I know about sting initialization in C,
which is that you can only initialize char strings if they are extern or
static.

Even after getting it to compile, the desk accessory didn't seem to do
anything; it merely exited to the desktop. Any idea what I might be doing
wrong? I ld'd the libraries in the order suggested (dastart.o, accskel.o,
aesfast.a, vdifast.a, dlibs.a) Any help would be appreciated.

>dcrevier@jarthur.claremont.edu

I am using STalker 2.0, which I purchased at the World of Atari show over the weekend. It is pretty nice! I have it calling into my three favorite boards, and logging me on. It then makes a pleasant chiming sound to notify I am on. I have been able to do all kinds of file munging with this going on. The only problem I have had so far is with large uploads - they sometimes spontaneously abort. Have not yet tried to isolate this one.

I use it at 19200 on a USR, and it seems fine. I do not think it does VT-100 at all, but could be mistaken. I have not yet tried to use it on the UNIX system I am now "working" on, only on Atari boards...

Can't help to add my two cents. I don't know if anyone else notices, almost in any popular PC magazines, such as Byte, InfoWorld, etc, every once while you will see a letter from an Amiga owner loudly protested a previous article, saying the article forgot to mention about his Amiga already can do so-and-so. It seems these people always feel insecure and need others attention.

Now can we just go back each's own newsgroup?

> there a blurb on how to it is done? Can some kinf soul send it to me
> please.
XBRA is based on a old proposal by Moshe Braner (hence the name, 'eXtended
BRAner'). It is a protocol for programs for revectoring system vectors
and looks like this:

dc.b 'XBRA' ; magic number for 'xbra was used'
dc.b 'FOOB' ; 4 characters unique id for the program (should
; be printable characters, id's starting with '_'
; are reserved for Atari)
oldvec: ds.l 1 ; contains old value of the changed vector
newvec: ...here goes the new code...

Using this protocol, programs can:
- find out, if they are already installed
- follow a vector chain up to the start

This protocol is officially documented by Atari Germany and is used
in ca. 100 german programs.

3443. GEMINI works on TOS 1.0 (so far).

Newsgroup: comp.sys.atari.st
Date: 1990-04-10 11:16:15 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000047@ux1.cso.uiuc.edu>
Source record: 241781

Don't know if you guys know this yet...

My TOS 1.4 is in the mail, so I decided to get Gemini 1.1 and test it out. Gemini.prg won't run, but mupfel and venus work independently, so... if you put all the venus and mupfel files into one directory... (I put them in C:\Gemini), and you set mupfel.mup to run venus.prg, you gen get a working version of the desktop. I haven't noticed any bugs yet (about 4 hours of fooling around) except for the same thing that happens in NeoDesk to WERCS... I assume it has to do with the autoboot.prg (which runs a GEM app). I've tried the one that uses a .INF in the root directory and one which saves the filename in itself (mkboot?), and they both cause WERCS to crash. If I take it out, I can run WERCS... any ideas? (Yeah, wait for TOS 1.4).

P.S. Are FATSPEED and PINHEAD incompatible when run in the opposite order? (i.e. PINHEAD then FATSPEED)

3444. re-direction

Newsgroup: comp.sys.atari.st
Date: 1990-04-10 13:25:59 UTC
From: ignac@electro.UUCP
Message-ID: <1602@electro.UUCP>
Source record: 241788

what is the "official" method of doing io-redirection in software.
what i want is for program A to run. It prints to the screen using Cconws();.
In the course of running A, it will invoke B, which also prints with Cconws.
Before B is called, the user has the option of redirecting B's
output anywhere (screen, printer, file, modem). After B runs, control is
returned to A, which will then continue printing to the screen as before.

So the question i ask is: what is the proper way for A to redirect B's output
before B is invoked. Or is this even the correct way of thinking about this
problem.

Any comments, code fragments, etc will be happily accepted and graciously
rewarded with thanx at this time!

Message-ID: <4862@BODEIS.CINECA.IT>
Source record: 241658

More on my defective SH204. It turned out that the 16L8 PAL placed in the Host Adapter is gone. Would someone be kind enough to tell me either a source for a new one or the fuse matrix ? I am not so skilful to reverse-engineer the Host-adapter and to reprogram a new PAL for ACSI-SCSI conversion.
Please e-mail me directly since I cannot receive INFO-A16 issues.

Many thanks,
Francesco Zanichelli

The way to insure that NO interrupts are serviced (including
MMU), is to mask off the interrupt bits in the STATUS register. I have
written a program to talk to the old 8-bit atari SIO bus through the
printer port which required that I read the port every 52.2 usec
(19.2kbaud). The disabling of all interrupts worked very well in this
case. The biggest drawback however is that the mouse is temporarily
frozen.

3449. ST list

3450. ST penpals list (Third posting)

Newsgroup: comp.sys.atari.st
Date: 1990-04-10 18:04:01 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9004110705.AA07100@ucbvax.Berkeley.EDU>
Source record: 241656

To *ALL* Atari ST owners worldwide!

Are you interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not got network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime). I am working now on a list for the UK and when both lists are complete I will Email a copy to everyone that wants one.

I hope that this generates a reasonable level of interest, so don't be shy! Contact me sooner rather than leter and lets all keep in touch! :-)

Regards,

Simon

Could you please send me some mail indicating success on your mono search? I crave mono capability, but I don't want to buy a disposable Atari one (anyone know if the new ones out RSN are any better?). My real interest it buying a color multisync, but since I have a color monitor already a mono multi might be the way to go. Also, the cable diagram you mentioned, if in mailable form would be really nice. Thanks!!

3454. JRI SIMM board

Newsgroup: comp.sys.atari.st
Date: 1990-04-10 20:11:00 UTC
From: HAMMOUDH@Wabash.BITNET
Message-ID: <9004110707.AA07333@ucbvax.Berkeley.EDU>
Source record: 241661

Hello!
In my never-ending quest for more memory, I have been told to look into JRI's SIMM board. No problem, except for one thing: How can I get ahold of JRI?
I found a number for John Russell Innovations in an article in a somewhat recent edition of STart (I believe it was Dec. '89 or Jan. '90). At the end of the article "The QueST for Speed" was an address and phone number for John Russell Innovations. The city was Pittsburg, California. The phone number given was (415) 458 - 9577.
I called and let it ring for about four minutes and received no answer. I then hung up and tried it again, but still no answer. I finally decided to call directory assistance and the operator said that there was no listing for John Russell Innovations in Pittsburg (except for something like a real estate business).
How can I get ahold of JRI??? Did they move? Any help is appreciated.
Thanks in advance.

-Hassen

I'd like the pictures, but I don't want non-text postings in this newsgroup.
The standard way to handle this kind of thing is to make a mailing list...
I'm not exactly sure, but I think that just means setting up a mail alias
and sending the stuff to the alias. Or you might set up a group in the alt
hierarchy: alt.pictures.spectrum, perhaps. Of course, even some people who
wanted them might find an alt group hard to get.

From: clark@mshri.utoronto.ca
Message-ID: <9004110307.AA28181@lash.utcs.utoronto.ca>
Source record: 241662

A friend of mine is moving to France from Toronto and is worried about problems that he may have with his ST. He has a step-down transformer to get to 120 V, but can't do anything about the difference in frequency. I expect that there won't be a problem for the computer itself, since it rectifies everything to DC anyway, but what about the colour and monochrome monitors, and the hard disk drive (sorry, I didn't think to ask the make). He also has Spectre 128 and the Translator. Are there any other problems he should be aware of, such as incompatibility of European software on North American machines?

Any info would be greatly appreciated. You can mail to me directly or post to the net, since I read the Bitnet compilations regularly.

>that's all I have seen about Atari in Japan.

Commodore Japan is still in existence, though they did down-size a few
years back. Commodore hasn't marketed computers in Japan; the Japanese
office was used for purchasing and production engineering up until around
the time the C128 and Amiga 1000 were introduced. Most of the production
engineering for Commodore is now done in the US and Germany. The office
in Japan is now used for purchasing. The reasoning for this is obvious:
doing any kind of business in Japan these days is just plain expensive.

3461. PC rag notices the TT

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 03:33:56 UTC
From: clark@mshri.utoronto.ca
Message-ID: <9004110333.AA29102@lash.utcs.utoronto.ca>
Source record: 241663

Having to deal with mserable-dos machines at work, I try to keep up with the field be reading a few pc publications. One of them, PC WEEK, is a weekly tabloid-style rag with lots of product anouncements and advertisments that they will send you free if you can convince them that you are responsible for buying lots of hardware or software for your company. (It's actually quite useful, and they are frequently very critical of IBM, which matches my opinion nicely.) One of the must-read columns is called Rumor Central, by "Spencer F. Katt", on the second last page. In the issue of March 26, 1990, he describes his trip to Taiwan to see what Intel is up to with the 586 processor, then continues:

"Of course, the Katt didn't return straight home from the land of Chiang Kai-shek. He hopped Lufthansa to Germany for the Hannover Computer Fair, and feasted his eyes on goodies being shown there, including a new Atari machine -- which runs Unix on a 68030 processor and will sell for less than $2000."

This reference to the TT is the only thing he says about the Hannover show. True, this wasn't a front page article, but maybe things aren't beyond hope for Atari if they can get some attention in a publication that describes itself as "THE NATIONAL NEWSPAPER OF CORPORATE MICROCOMPUTING". (Being a Canadian, I will give them the benefit of the doubt and assume that by _national_, they mean _not-regional_, and don't mean U.S.A.)

I just thought there might be some interest.

Logic circuits (poorly designed) ARE subject to heat. The propogation delays get worse and the logic voltage levels degrade. This can put poorly designed circuits over the edge.

Since PC-DITTO-II supposedly had timing problems initially, perhaps this is just a borderline symptom. Then again, it could be something completely different.

|
| Just use the quote character. (In gulam/ue, this is ctrl-Q. It's probably
| the same in most other emacs' as well.) Edit your emacs.rc file and type
| (Ctrl-Q)(Delete) and you'll see '^?' echoed.
| --
| -- Howard Chu @ University of Michigan

In emacs3.10, you must use the 2 characters sequence ^ and ? in
startup file (.emacsrc, emacs.rc). It is clearly written in 3.10 doc, page 15-29:
"... control D character in the startup file is represented visibly as an
uparrow key followed by a capital D." (to explain a bind-to-key using ^D).

This works for me, under various machines. ^Q<del> did not work.

Here is what I use in Arcgsh for io redirection to call Zoo (hence
some names) as a dependend program (partly cited). "zoo_stdin" and
"zoo_stdout" are filenames, the "...descriptors" are ints, STDIN is 0
and STDOUT is 1.

```
/* redirect standard input: */
save_stdin_descriptor = Fdup (STDIN);
my_stdin_descriptor = Fopen (zoo_stdin, 0);
if (my_stdin_descriptor >= 0)
Fforce (STDIN, my_stdin_descriptor);

/* redirect standard output: */
save_stdout_descriptor = Fdup (STDOUT);
if (append_to_stdout_file)
{
my_stdout_descriptor = Fopen (zoo_stdout, 2);
if (my_stdout_descriptor >= 0)
Fseek (0L, my_stdout_descriptor, 2);
else
my_stdout_descriptor = Fcreate (zoo_stdout, 0);
}
else
my_stdout_descriptor = Fcreate (zoo_stdout, 0);
if (my_stdout_descriptor >= 0)
Fforce (STDOUT, my_stdout_descriptor);

/* call the program now... */

/* undo the redirections: */
Fforce (STDIN, save_stdin_descriptor);
Fclose (my_stdin_descriptor);

I did post this readme file. Claus Brod does not read this newsgroup.
So he will not be able to react.

However, *I THINK* I know why CBHD redirects TRAP #1. With this driver
you can boot from all harddisk partitions. Which means that:

1) All auto folder programs are read from the boot partition
2) The same goes for the ACC's
3) And for the DESKTOP.INF

4) If you save the desktop it is saved on the boot partition.

The latter is new in CBHD 3.5. Formerly the desktop.inf was allways saved
on C. I think Claus had to redirect the TRAP #1 vector to make this possible.
Is there another way?

3468. TOS 1.4 official ???

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 11:09:52 UTC
From: felner@inf.ethz.ch
Message-ID: <20127@ethz-inf.UUCP>
Source record: 241668

OK, I just had a chat with my dealer here in Switzerland about TOS 1.4.
He said there is *no* official TOS 1.4 yet. The current 1.4s are all
beta versions. The current 1.4 is the same as 1.6 without the STE
specific stuff. The official and final 1.4 (or whatever) will be due
this fall when the TT will be available. It will contain code for full
support for a real SCSI interface (-> TT) and also all the STE specific
code, i.e it seems to be exactly the same chipset for all three machines.
Also, all the currently known bugs will be fixed (like all the stuff
that is taken care of by poolfix, tos14fix, etc).

He got all this information from Atari Switzerland.

He also mentioned that the final upgrade kit for 1.4 will not only
contain the ROMs but also a new keyboard chip (the 6301) and new keys
for the keyboard (at least here in Switzerland). I didn't quite
understand why ...

Anyone has any comments on this? Atari??

Confused, Tomas

BTW, my dealer is the biggest Atari dealer in Switzerland, so I
assume he has the latest and correct information.

3469. Need Help with ST520 Memory Problem

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 12:42:52 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1583@lzsc.ATT.COM>

3470. Re: yet another screen saver question

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 12:45:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900411124545.239107@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 241652

I am the one who asked the original quesiton. I would like to sum up the answers and thank every contributor.

>...I wouldn't leave monitors on all the time, screen saver or no
>screen saver. The constant heat from the power supply etc will
>eventually dry out the electrolytic capacitors. It happens quite
>regularly with other makes (such as our Phillips-made Apollo 19" mono
>jobs)

Statements like these meet my own experience. I know of an installation of about 70-80 STs, where the monitors are left on all the time. The people frequently encounter monitor problems due to defect electrlytic capacitors. There are a handfull problematic parts especially in the "horizontal offset controller" (Horizontalablenkstufe). Among them are C 915 (my own monitor), C 711 (had to be replaced in our old model sm124 in the office) and a few others. Some of these parts could easily be replaced by non-electrolytic capacitors to increase the long term stability of the sm124. Hey Atari, this is Your job!

My conclusion from all the contributions:

Switch the monitor off when You are running a long and stable job (like Metafont or long compilations). The time should be measurable in hours. Then it will be harmless to both the ST and the monitor.
The argument that switching electronic equipment on and off frequently could damage the equipment is surely true. But in the case of a tv or computer monitor frequently means every few minutes, like a screen saver and not every few hours. So I think it is useful to do both things: install a screen saver program (something like idle12 or pyro) and switch the monitor off when You don't need it for a long time.

Thanks,
Michael Ritzert

When things are failing, you cannot define the failure mode.
The PC-Ditto II m68000 connector is so flackey by design that any and all
screwey results are possible.

A row of ribbon connector pins is not stable enough to make a reliable pressure
joint. And the shoulders of a M68000 are absolutely not designed to be a
conatact point.

SOLDER the SOB on and your problems will go away.

I did this, and two things happened:
1. PC-Ditto II now works great.
2. Half of my memory is now bad.

Howard C. Johnson Two things happen when you touch a soldering iron

>Has anyone out there managed to connect an IBM-type hard drive to an
>ST via the DMA port using a modified IBM controller?

Yes.

It is possible - and pretty cheap - to connect an OMTI controller for
the XT to the DMA Port.

But it's incompatible to everything: the DMA Port is blocked by this
thing, and it needs a special driver to run which is availeble only for
TOS (rumor has it that a minix-ST version is availeble too; rumor has
it, that rumor is just rumor...)

Well, if You can afford it: go for SCSI: SCSI devices will be usable in
the future, the SCSI host adaptors for the ST are more or less
compatible to the SHxxxes etc.

3474. Emacs 3.10 upgrade

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 13:57:23 UTC
From: lutz@UAIMZA.MATHEMATIK.UNI-MAINZ.DE
Message-ID: <9004111357.AA23222@uaimza.mathematik.uni-mainz.de>
Source record: 241667

During the last weeks I heavily modified and tested the MicroEMACS 3.10
version for the Atari ST.
As it now seems to run stable, I'd like to offer all those of you who are
interested the opportunity to get this version (binary plus source).

Following changes/additions to MicroEMACS 3.10 were made:

- it now gets all filenames via the AES fileselect box (using fsel_input or
fsel_exinput depending on the TOS version used).

- it now always uses the GEM mouse (even when started as a TOS/TTP application).

- it now uses the complete ASCII character set (1-255). This is _most_
interesting for all those foreigners (like me) who like to bind macros
to any key or to do replacemets with anything that can be typed in
(without encountering bombs).

- all shell-functions now work correctly (new system() function written);
at least when using MSH (Mark Williams Microshell). I'm going to change
this function to the new ARGV specification when I get hold of a UNIX-
like shell that uses the new ARGV specification _and_ supports piping
(so I'm not talking about MUPFEL -- one of the GEMINI-twins -- because
it lacks the latter and is therefore no real replacement for MSH).
Alas, MSH's build-in language isn't very helpful for writing shell scripts,
(but otherwise it's a fine piece of software) so I'm thinking about writing
my own shell.

- some changes concerning the keycode were necessary (well, there _is_ a
difference between the keyboard scancodes of an Atari ST and those of
an IBM clone ...)

```
key value PC name description
-----------------------------------------------------
help M-? help
undo ^G abort-command
^Crsr-up FN^Z (^page up)
^Crsr-down FN^V (^page down)
S-Crsr-left ^A beginning-of-line
S-Crsr-right ^E end-of-line
S-Crsr-up FNZ page up next-page
S-Crsr-down FNV page down previous-page
S-home FN> end end-of-file
home FN< home (pos1) beginning-of-file
S-tab S-^I backtab
```

the function keys now return:

normal: FN1 FN2 ... FN0
shift: S-FN1 S-FN2 ... S-FN0
alternate: A-FN1 A-FN2 ... A-FN0
control: FN^1 FN^2 ... FN^0

- fence-matching in CMODE now works: the cursor was switched off so no one could see it jumping to the matching fence, funny eh ?

- it's now possible to compile a version in which the status line appears in reverse video.

- the environment variable HOME may now be set (see EMACS.TXT p. 46) as the bug which didn't allow MicroEMACS 3.10 to use its value correctly has been removed.

- several minor optimizations/corrections (Atari dependend source files)

- some code has been rewritten to speed things up (screen-update, ...)

Some things for the future:

- future versions will correctly read the current screen resolution and set the internal variables to these values. This will enable MicroEMACS users to take advantage of the full screen size (OVERSCAN, BIGSCREEN, ...) without having to change EMACS.RC.

- I'm going to partially rewrite the MW-C file-I/O-functions to speed things up. MW-C does all its file-reading through a 512 Bytes buffer which is a very slow way of doing it. Enlarging this buffer to 2048 Bytes (or even larger) will very much speed up the (currently) boring process of reading large files.

Maybe there's someone out there who knows a way of doing this without having to rewrite the MC-C file-I/O-functions ???

(an undocumented variable that does the trick would be _very_ fine ...)

3477. Detecting whether GEM has finished loading yet

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 18:46:31 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr11.184631.487@wam.umd.edu>
Source record: 241671

Is there any reliable, documented way to tell whether or not GEM is fully loaded? I want to run a program from an AUTO folder that replaces the GEM process termination vector at $408. If I set the vector in the AUTO folder, GEM just clobbers it when it comes up.

Currently, I install a VBI which waits for a fixed amount of time, and then sets the vector. This works, but is (obviously) not guaranteed to work in the future.

Is there an Atari-sanctioned way to pull this off? I notice from the Headstart documentation that Johnson & Eidsvoog do something involving the line F trap. I don't see why one has to resort to such tactics.

Ideas?

Dave Baggett
dmb@cscwam.umd.edu

3478. Splitting comp.sys.atari.st into subgroup(s)

Newsgroup: comp.sys.atari.st
Date: 1990-04-11 18:59:39 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr11.185939.656@wam.umd.edu>
Source record: 241672

Well, so far there are three votes for and two votes against the idea of splitting this newsgroup. The votes in favor seemed to be along the lines of "I'm really sick of reading these flame wars and financial statements" and the votes against were "there's not enough traffic".

Obviously, if only five people care either way, it's unlikely we'll get 100 votes in favor of each new group.

Would anyone be in favor of at least separating the technical stuff from the general stuff? Before, I was undecided about the whole thing, but now (having taken a peek into comp.sys.amiga.tech) I think a comp.sys.atari.tech group might be a good thing. I think there's enough traffic for it, and it would (I belieive) generate more technical discussion from those people who will read just that group and not comp.sys.atari.st (general). Just my opinion.

>> door. At least Atari has announced a UNIX '030 box. C= is too embarrased
>> about their latest "creation" to even show it to the outside world.

This is a "foot in mouth" waiting to happen if I ever saw one. CBM has Unix
up and going in Europe, and isn't released yet here for a few good reasons
including the need to have dealers that are able to support it. From
the people that have gotten their hands on it, they have said it is one of
the nicest implimentations out there. Certainly better than Apple's. Since
the few places I know you can get ST stuff are mail order, do you think any
company or College is going to buy a Un*x workstation, which needs constant
support, from a Crazy Fredy's mail order house.

>> 2. The Amiga chipset is nothing to brag about. When in use, they just bog down

>> doing equivalent operations. The ST DMA chip does floppy and HD access from
>> 2 to 10 times faster than anything C= an put out. Also, Atari has seperate
>> chips, so accessing the HD won't slow down the blitter.

This is totally incorrect. My 68030 hums along at 25MHz without any
knowledge that there are coprossesors, while they are performing advanced
system/graphics/IO processes. This paragraph is nothing but lies. The
CPU in an Amiga has NOTHING to do with what the co-processors do. I have
heard from CBM and Atari developers that the Amiga Blitter is much more
powerful then the Atari, however since I am not 100% learned on them BOTH I
will leave that discussion to people who know what they are talking about.

>> One last thing, the ST double sided drive can hold 900K, not the lesser 880K
>> that Amiga holds. At least get your facts and figures right. Also, you might
>> get a more responsive audience on comp.sys.amiga than on comp.sys.atari.st.

Sure you can use a hack that dumps raw data onto a floppy and get's 900K on
your ST. You can also use the FastFileSystem and others on an Amiga floppy
that get almost 1Meg with about a 200% increase in speed. This is not
important. What IS important is that all the Original 520ST's had Single
Sided drives, so unless developers what to exclude those, they have to release
all their software in the SSDD ~360K format. The original Amiga where equipted

with the same drives that they are using now.

>> Jack Knight

>> flames -> /dev/null
^^^^^^^^^^^^^^^^^^^
Stupid users get flamed no matter what, so you can get rid of this if you want.. and I would strongly suggest you do.

I would hope that when The Amiga UN*X Workstations start selling, and you sell all you ST stuff for the most you get get for it in order to pay for part of a $100 internal Floppy drive for YOUR new Amiga, that you would post a note saying how foolish you had been all this time.

Instead of splitting up the group, how about adopting a keyword
like "TECH:" in the subject line. Or perhaps in the Summary line.
Or hey put it in the keyword line!

The advantage of the subject line is the I know how to eliminate
the non-TECH: articles. Perhaps there is a better way.

So far it's holding up. But I am having intermittent video glitches
that may or may not be related to the clip.

I agree with you, the clip looks extremely lo-tech. I was expecting
something that really cliped on, not just slipped over the pins.

I *really* put a lot of pressure on the clip's pins to bend them in
(before I put it on the 68000, of course). My first few attempt didn't
work. The hard part is bending the pins evenly so they all apply the
same pressure.

>
>2. Has anyone attempted to just solder the thing on?

I tend to agree.

shalom, lawrence

3484. Re: Splitting comp.sys.atari.st into subgroup(s)

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 03:57:35 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr12.035735.5672@wam.umd.edu>
Source record: 241677

Eric C. Olson writes:

>
>Eric
>ericco@ssl.berkeley.edu

One of the main reasons for splitting up the group is so that the
people who are interested in just tech discussions (and there seem
to be quite a few) won't have to wade through the other stuff. If we
just use a keyword, then

1) newcomers won't know about it
2) people will eventually forget

and we'll be back to where we started.

The way you would eliminate non-tech articles with the new group in
place would be to not read comp.sys.atari.st (general), but only
read comp.sys.atari.st.tech.

3485. GEMINI BUG...

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 05:50:08 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000049@ux1.cso.uiuc.edu>
Source record: 241678

To the authors of Gemini:

I think I isolated the bug created by sbreak... Maybe you
did too, but it has to do with the mouse being moved after a graf_
mouse(M_OFF,0) instruction is called. Somehow when the mouse is
turned back on, the mask is not drawn at it's new location, but
at the old one (had the mouse stayed in place after a M_OFF).

-- Greg

3486. FTP

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 07:08:54 UTC
From: So01@Dmarum8.BITNET
Message-ID: <9004120708.AA04683@ucbvax.Berkeley.EDU>
Source record: 241679

Today i received to following from another list, of course it is
of interest for some of you.
greetings
Thomas Neser <So01@Dmarum8.Bitnet>

---
original mail follows

Received: by PUCC (Mailer R2.06) id 4044; Wed, 11 Apr 90 09:21:37 EDT
Date: Wed, 11 Apr 1990 09:21:27 EDT
From: Princeton BITNET FTP Server <BITFTP1@PUCC>
To: SO01@DMARUM8
Subject: List of Hosts that Accept Anonymous FTP Requests

This is my list of Internet sites accepting anonymous ftp:
user name: anonymous
password: <your mail address> (i.e. "odin@pilot.njin.net")

This list is posted to comp.misc, comp.sources.wanted, and
alt.sources.wanted on Usenet and is distributed via anonymous FTP from
pilot.njin.net (128.6.7.38) as well as being available from several other FTP
sites (see list). I don't have the time to read the *.sources.wanted news-
groups so if there is anything you want me to see, please use email. There
is also a mailing list which was being used to distribute the list, now I use
it more for getting feedback on new ideas. If you wish to be added to the
mailing list mail me at pilot.

Special thanks goes to Ed Vielmetti for all the work he does posting new
archive information to comp.archives.

If there are any corrections/updates/etc. to be made please mail me at
odin@pilot.njin.net. That also goes for descriptions of the archives. I
don't have time to personally check each and every site so if you use a site
regularly and can put together a better description, please tell me so I can
update this list. This is especially true for sites described as "unknown"
or with vague descriptions. Those sites are ones that I either didn't have
enough time to sort through it or I couldn't tell what was available.

Thanks,
Jon Granrose
January 20, 1990
+=+=+=

to non-prime hours (1900 - 0600 hours local time for the site). This is
especially true for sites not in your country. Please keep that in mind when
you are FTPing. None of us want to see sites start to close down because a
few are being inconsiderate.

```

Please please PLEASE make this optional! I can't stress enough how much I
dislike dealing with file selectors and such in a text editor. If I wanted
cute little windows and boxes popping up all over the place I'd use a
GEM-based editor like 1ST-Word Plus, not a Unix-style editor like Emacs.
Thank you for taking this into consideration,

Nick

My version of Sozobon C would not compile this unless I changed 'char' to 'static char'. This agrees with what I know about sting initialization in C, which is that you can only initialize char strings if they are extern or static.

Even after getting it to compile, the desk accessory didn't seem to do anything; it merely exited to the desktop. Any idea what I might be doing wrong? I ld'd the libraries in the order suggested (dastart.o, accskel.o, aesfast.a, vdifast.a, dlibs.a) Any help would be appreciated.

3489. Re: Univ. of Edinburgh public domain ST software?

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 11:08:57 UTC
From: ngse18@castle.ed.ac.uk
Message-ID: <3259@castle.ed.ac.uk>
Source record: 241682

In article <2903@rodan.acs.syr.edu> jfbruno@rodan.acs.syr.edu (John F. Bruno) writes:
>In the March 1990 ST World (the U.K. mag) on page 42 is a letter from
>Tom Jones, Dept. of Meteorology, Univ. of Edinburgh. The letter states that
>Edinburgh is maintaining an on-line library of public domain ST software.

I don't think Tom reads c.s.a.s often (not that I read all of it!), so perhaps, as another user of Ed U facilities, I can answer. Note that I have not seen Tomsk's letter in ST World; I am answering John Bruno's question.

Edinburgh University does *not* maintain an online library of ST or any other software. The address quoted by John refers to the UK National Public Domain Software Archive, which is maintained by Lancaster University. Note that the UK academic community has its own networking system - JANET - based on near-OSI protocols. There is no transparent gateway between JANET and the Internet, so Internet access to lancs.pdsoft through ftp is not possible. The NPDSA has recently started to offer a mail service, but I believe that it does not respond to requests from outside the UK. In other words the UK-NPDSA serves the UK *only*. I know a little of the financial structure of JANET, and the reasons come down to there being no-one to pay the associated bills. So all flames to /dev/null, please.

As far as whether there is anything at lancs.pdsoft which is not at terminator, I do not know. I *do* know that most of what is at lancs.pdsoft *is* at terminator. I do not know whether Mark Hobart (who I believe manages the Atari area at lancs.pdsoft) corresponds directly with Stephen Grimm (Stephen? Mark? are you there?).

>
> Any comments or help would be very much appreciated.

Format 11 is a disk formatter, which arranges the disk in an eleven
sector per track format.

Personal Opinon: This is too far beyond specs to be reliable. Don't
store anything you really need on such a disk.

If your disk was write protected, the formatter should have been unable
to modify it. However, your note indicates that it is now unreadable.

If you have access to any of the disk copiers, make a backup copy of
the disk first. Make a couple, in fact.

If only the boot sector is destroyed, you have hope. If the FAT and
Directory have been destroyed, you now have a scratch disk, suitable
for formatting.

The easiest way I know to rebuild the boot sector (pardon my humility)
is to use the REPAIR function of VKILLER (version 3.00 or higher,
posted here a few months ago, and available in the May, 1990 issue of
STart Magazine).

If you know how the disk used to be formatted, just enter the old
parameters in the dialog you get from clicking on REPAIR. If you don't
know, let it go figure out what it can read, and fix up the boot
sector. Then, if you find the FAT and Directory still intact, consider
yourself fortunate.

> you done to keep a working connection. Has it held up?
>

I have spent many hours trying to get the thing working, often ending
up by being *certain* that something other than the clip was at fault.

The trick is to bend the pins on the clip well inwards and then make
certain that the two rows are *dead straight*. A single pin out of
alignment and it will not work at all.

Once you have done this it will stay clipped on and (in my case), working
through fairly rough handling.

Right. I slopped the code together in a hurry and posted it (a year ago!)
without testing it. And sure enough, it was hosed up. Arggh! I hate it
when that happens. It's pretty hard to make an excuse when you repost a
year-old mistake.

At least this time somebody actually tried to compile it. :-)

>Even after getting it to compile, the desk accessory didn't seem to do
>anything; it merely exited to the desktop. Any idea what I might be doing
>wrong? I ld'd the libraries in the order suggested (dastart.o, accskel.o,

You didn't do anything wrong. I typed in a couple of things from bad
documentation -- the description of AES messages on page 516 of "Atari ST
Application Programming" by Pollack and Weber. The lesson here is twofold:
One, don't post untested code, and two, NEVER believe any documentation about
the ST* until you have checked it out three ways.

(* Same could be said for anything read on Usenet.)

AC_OPEN is 40, not 30. And the DA's apid should be found in msgbuf[4],
not msgbuf[3].

Corrected code follows.

```
#define MENU_ID " File selector "
#define AC_OPEN 40

#ifndef GEMFAST
int contrl[12], intin[128], intout[128], ptsin[128], ptsout[128];
#endif

main()
{
int apid, menuid, msgbuf[8];
apid = appl_init(); /* say hello to the AES */
menuid = menu_register(apid, MENU_ID); /* add me to the Desk menu */
```

```
while (1) /* loop forever */
{
evnt_mesag(msgbuf);
if ( (msgbuf[0] == AC_OPEN) && (msgbuf[4] == menuid) )
wakeup();
}
appl_exit(); /* you'll never get here -- supposedly */
}

wakeup() /* Whatever needs to be done. Here we display the fsel ... */
{
char path[128], defult[13];
defult[0] = '\0';
int button;
fullpath(path,"*.*");
fsel_input(path,defult,&button);
}
```

3494. One world, One CPU, One OS

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 14:43:21 UTC
From: demon@desire.wright.edu
Message-ID: <93.26244db9@desire.wright.edu>
Source record: 241687
Cross-posted to: comp.sys.mac,comp.sys.amiga,comp.sys.atari.st

Reading the articles that say how alike Amiga, Atari, and Mac users are:

It would be nice if these users could all have one unified operating system. (Yes, there is UNIX but not everyone has 4-8 meg of ram and 80+meg hard disks.) What does Apple have to lose by liscensing the Mac OS to Commodore and Atari?

Not much. Some sales to be sure, but not enough to erode their profit levels. After all, people have proven they don't mind paying Apple's prices by buying Macs in the first place.

What they have to gain is enormous. They could double their installed base of Mac machines (making software production more viable) while having low cost Macs (from Atari) available without watering down the current Mac line. In addition, the Mac OS would become the second leading OS, behind DOS and in front of UNIX (which Commodore and Atari will have to go to otherwise). OS/2 will not be viable for PC's. (Arguments against that statement should be directed to comp.sys.msx :)

Making a mistake like IBM did? Clone wars to follow? Of course not. They wouldn't be liscensing Mac computers, just the Mac OS. The other machines would still be Amigas and STs.

Well? Please, discussion only. Flames should be directed to alt.flame, where they belong.

Brett Kottmann

3495. Proposed change to names of sources/binaries postings

Newsgroup: comp.sys.atari.st
Date: 1990-04-12 16:14:32 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <1588@male.EBay.Sun.COM>
Source record: 241688

Someone has suggested that since software to automatically save news articles using the filename in the "Archive-name" pseudo-header line, I should stop calling the articles program/part01, program/part02, etc. and start calling them program/program.uaa, program/program.uab, and so on. This would enable Dumas uud to pick up the parts effortlessly.

Personally, I'd like to see Dumas uud hacked to take multiple filenames on the command line instead, but it's no problem for me to use the proposed filenames if people prefer that.

Comments?

```
| Can anyone post a clarification of what is going on with the magazine
| (Atari Explorer) and Atari itself.
```

There was a post to Genie about 2 weeks ago by an Atari spokesperson (I think it was Bob Brodie) and the essence was that Atari Explorer was moving under direct control of Atari in order to provide a better mag. The last issue of the old Atari Explorer was supposed to be mailed out ASAP (I haven't got mine). There was wording about commitment to subscribers and advertisers remaining a high priority.

That was all the statement said.

I find this curious, about 3 months ago I got an early renewal request from Atari Explorer claiming "we need to demonstrate subscriber commitment to our advertisers so please renew early and we'll give you a nice discount".

> int button;

Again, Sozobon didn't seem to like this. I had to move the "int button;" up above the "defult[0] = '\0';". After that it worked fine. Did this compile on your machine or was it a last-second change made while posting it? (I don't think I'm using the most recent version of Sozobon; some newer compilers do allow declarations in the middle of code.)

Anyway, please continue to post source code examples, they are very informative and useful.

Date: 1990-04-12 18:00:07 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <16990@eagle.wesleyan.edu>
Source record: 241692

I have a text file which describes how to battery backup the IKBD keyboard clock. However, it refers to pins 1, 13, and 16 on the connector between the keyboard and main board. My connector has only 8 pins. Could someone with better technical notes than I have post a pinout for this 8-pin connector?

The pins I need specifically are:
a) Vcc line from main unit
b) Reset line
c) Ground

Any help appreciated. If someone from Atari Corp. (Allan?) could comment on this it would be very helpful. Thanks...

I am currently working on a hard disk controller project in my spare time, to hook a standard ST506 disk drive up to the Atari DMA port using my own microprocessor/drive controller design. Yes I realize that it has already been done :-) , but I hope to have intelligent cacheing, and the use of the processor (transputer) as a co-processor.

The project originally started as a low cost way to get a hard disk drive hooked up to my ST (at the time they cost about 600 pounds) and at the same time play with a transputer. The original circuit used the DMA port in a very non-standard way and as a result was very slow.

It was then a challenge to modify the circuit to use the DMA port in its proper mode to get the same performance as a bought drive. I used a logic analyser to examine the DMA port interface (oh for just a glance at the Developers Kit documentation on the DMA port :-) :-)), and eventually worked it out. Unfortunately most ST books give only a cursory description of how to drive the DMA controller, the best I have is the Abacus book "Atari Disk Drives Inside and Out", but it still leaves a lot to be desired.

Anyway, I am almost there. I can now format my drive using either the ICD or Supra software, and so use it. However my debug system tells me that some ASCI/SCSI commands are recieved which are not documented in the above mentioned book. I don't know what they do, so cannot write the code to emulate them.

It would help enormously if someone could send me a list of the commands recognised by the Adaptec 4000 board (the one I am trying to emulate at present), or any other relevant information. Apologies in advance if this information is company confidential (but people clone IBM's don't they :-) in which case please inform me.

Also is the extended partition format (stored in the boot sector of the drive) as used by ICD and Supra in the public domain? and if so does anybody have details of it? Presumably it is an extension of the normal boot sector as described in ADDIAO. Any pointers to further information sources will be gratefull expected, although I suspect that it is fully documented in the Developers Kit :-)

BTW, does anybody in the UK know how much the Developers Kit costs? And if so how can I tell if it worth the money, after all I don't want to buy anything that I can't examine first (is this a common problem?).

I'm better with numbers:- One point that should be remembered in
this context is that here in Europe we usually get the parts in
different order than what they are meant to be so when numbers are
in sight I can better go Next and Previous to cellect the parts
in right order.

From: ncastellano@eagle.wesleyan.edu
Message-ID: <17039@eagle.wesleyan.edu>
Source record: 241698

With Pinhead 1.5 installed, if I run Uniterm, then exit and try to use Jove, Jove gets confused and mixes in all sorts of garbage with the filename specified, and then complains that it can't find the mangled filename. Disabling pinhead manually with ctrl-shift-alt 0 before running Jove solves the problem until I run Uniterm again. Putting "JOVE.TTP" in my pinhead.dat does NOT solve the program. Any idea how I can avoid manually disabling Pinhead every time I run Jove after using Uniterm?

System config:
1040 ST, 1 meg
Auto:
pinhed15.prg
Shell:
gulam.prg
Uniterm:
version 2.0e 011
Jove:
the version recently posted in binaries group

>Commodore and Atari?

[...]

What would Apple have to gain? What would Commodore or Atari have to
gain? Essentially nothing. If Amiga and ST users had wanted Macs,
they would've bought Macs. I wanted something that multitasks, which
the Mac doesn't (except in a very limited sense), and believe that
very few Amiga users would trade AmigaDOS in for a Mac-like interface.
Of course, most Mac users are also happy with their machines and
wouldn't trade theirs for an Amiga. To each his own.

There is a file on terminator called 25MEGADD.ARC which explains how to exapnd a 1040ST to 2.5 megs by replacing the existing 256K chips with 1 megabit chips. Unfortunately, the arc file is corrupted and I can only read the first paragraph. Is it as easy as it says in the introduction? (Just unsolder the 256 k and add sockets for 1 meg chips?)

Also, did anyone ever purchase a CPU case from tech-specialties?

I re-compiled me3.10 (making many of the same changes) with the Lattice 5.04 compiler, resulting in a doubling of I/O speed (i.e. files load in half the time), also it came in some 15K smaller.

You ask for it, you got it. OS9/68K can be had for all three machines.
Now if we could just convince all three companies to use OS9/68K as
their basic OS we would be in computer heaven. Now that the new
RAVE software is out, some real fancy graphics could be done, and
even that would be portable between machines. It will never happen.

*** NO, Don't do it ***... Yes, it can be done, I did it, but
check your mother board version. In the end, the file was good
for one thing only, the chip pin out diagrams. I had to trace
all my lines to find the right ones to cut... I have a rev C.
1040 board (blitter socket), much different than the one the
author had. It would seem to me that one would be better off
getting SIMMS and wiring them in. You must modify the sockets...,
cut many traces... etc. Good luck, if you need help, email me.

Please keep the numbers. Arabic numerals are one of the few universal
pleasures in the world. Language may screw up a,b,c but not 1,2,3.

Also, using uud, just append the files all together and apply uud.
No fuss, no muss.

No changes to the Dumas uud program are necessary. The program is pretty
smart, it does a two-part search for the continuation files already. First
it looks for the named file, e.g. program.uab, but if that file doesn't
exist it merely continues to read its current input file. So, to decode a
multipart posting, merely
cat part* | uud
and you get the output file, no muss & no fuss.

I noticed this by reading thru the code posted in comp.sources.atari.st,
volume 2. If you're not using this version of uud yet, you should switch.

It seems that this is the problem, and I have given up, in the process
deleteing all copies of Format 11 (I found the originals, and the doc's say
that the writer won't be held responsible (I have no problem with this) and
that is about all. No info on what it does to your disk).

> The easiest way I know to rebuild the boot sector (pardon my humility)
> is to use the REPAIR function of VKILLER (version 3.00 or higher,

This also met with no success.

What I still find incredible is that this program did this to my disk with
the WRITE PROTECTION ON. How? (The drive made a real good noise as it sounded
(to me) that the head was traversing the sectors from the inside, out).

I've run across this with both versions of Goemini and it is one of the reasons I'm discouraged from using it. Gemini seems to be dependant upon AMC GDOS to use the Gemini and TMail screen fonts correctly. This wouldn't matter so much except for the fact that if you use the Gemini desktop, you can't use the G+Plus auto-install option with Gemini, to my knowledge. This forces you to create a single assign.sys file that works with everything. This is a real limitation because Opus is VERY picky about how the assign.sys file is set up. To Stefan Eissing or any other knowledgeable Gemini/Venus experts: Is there any way to use G+Plus Install with Gemini? Can you force Gemini to temporarily "let go" of GDOS before executing another GDOS program? If not, is there a way then to force Gemini not to use GDOS at all?!? This is the only reason I have to *not* use Gemini. Are there any G+Plus experts that know of a work-around? Please, someone, ANYONE - what's the trick?

Craig

P.S. Yes, I have TOS 1.4

Actually, Atari and Commodore would be the losers if they adapted the Mac OS. There's a lot about the Mac OS that just shows bad design and decision-making on the part of its designers.

Anyone who'd give up the Amiga's unique and fairly efficient OS for one that has to fake multi tasking becuase it's designers were to dumb to include interrupts should be shot.

Atari owners would have to give up their superior DMA and overall system speed.

The Mac OS and its evolution seem to represent a band-aid approach to fixing flaws they inherited from the start.

>this fall when the TT will be available. It will contain code for full
>support for a real SCSI interface (-> TT) and also all the STE specific
>code, i.e it seems to be exactly the same chipset for all three machines.

i have to see that to believe it ....

I think this is another story / tale of the Atari 1.4 Story.
Hopefully this information is true !!!!

in advance

3525. Can Mac SCSI devices be used on an ST?

Newsgroup: comp.sys.atari.st
Date: 1990-04-13 19:59:18 UTC
From: gat@gator.cacs.usl.edu
Message-ID: <6701@rouge.usl.edu>
Source record: 241719

In the not-too-distant future, I will be in the market for a new computer. I currently own an ancient Mac 512K which has been upgraded about as far as it is worth without buying a new machine. I have heard many positive things about the ST and the Mac emulators for it and am considering as my next machine.

However, it will be some time before I could afford an entire system and I would like to try to stretch the life of my Mac a little longer by getting a hard drive. The problem is, if I purchase a SCSI drive for the Mac (in particular, a Syquest drive) will I have to ditch it if I should buy an Atari? Or do drivers exist which would let me use it with an ST?

If you know anything about this please e-mail me and I'll summarize if there is some interest.

Thanks,
Gary Thompson

It has been hacked. I've mailed out several dozen copies of a version
that decodes as many files as you want (in fact, I routinely decode all
of the ST and PC files I pull of the net with a single command). I'll
send a copy to Steven, although since I asm not the author of the
original, I really don't feel in a position to make a formal submission.

^^^^^^^^^^^^^^^^^^^^^^^^^^^

I agree with your comments about the ST -- I used to have one myself,
but have you ever really seen OS/2? I wouldn't call it out of date,
considering it has features not present even in the latest UNIXes, like
advanced interprocess communication, shared dynamic-link libraries,
multi-threaded applications, and a windowing/GUI subsystem. It is a
real OS that has nothing in common with MSDOS except the similar
shell syntax. Really, don't comment on it if you haven't used it!

>

If you get a chance, do check out OS/2. I used to program GEM when I
had my ST, and loved it -- at the time. Now I program for OS/2 PM.
You don't even have to look closely to find that the object-oriented
OS/2 Win and Gpi libraries blow away the ST's AES and VDI, respectively.
An example is that Win and Gpi know about each other, while AES and VDI
don't. Because of this, if you want to draw a line in OS/2 PM, you don't
have to go querying the window manager for the visible parts of your window;
All output is clipped to it automatically. Those of you who've programmed GEM
know what I'm talking about. I do have to admit, though, that programming
the ST is cheaper and there is less to learn. But honestly, it's a less
powerful system than a PC running OS/2.

>In article <93.26244db9@desire.wright.edu> demon@desire.wright.edu writes:
>> What does Apple have to lose by liscensing the Mac OS to
>>Commodore and Atari?

I remember when it seemed like the Apple][line had the PC market about
locked up until IBM came out with the PC. The main difference in courses
of action IBM has taken in comparison to Apple is that IBM has provided
the opportunity for clones, vastly incresing their "standard." One just
has to think back to the days of Franklin Computer to see Apple's
course of action which contunues today.

If Apple were to license their OS to Commodore, Atari, or whoever, I
don't think their sales would really lessen, but that overall demand
for the Mac-OS would increase across the board, including demand for
the Macintosh. When other MS-Dos machines emerged, sales of IBMs
didn't drop through the floor, conversely, they have remained strong.
I believe Apple has the reputation to insure that their sales would
continue to be strong. Furthermore, a little more competition in the
Mac-OS industry certainly couldn't hurt.

3535. Looking for a Graphics Standard beyond ANSI VDI

Newsgroup: comp.sys.atari.st
Date: 1990-04-14 11:07:23 UTC
From: tcamp@dukeac.UUCP
Message-ID: <1854@dukeac.UUCP>
Source record: 241729
Cross-posted to: unix-pc.general,comp.sys.ibm.pc,comp.sys.atari.st,comp.windows.x,comp.graphics

Looking for a Graphics Standard:

I have been developing for some time a project called "Space Flight Simulator." Up to this point I have been utilizing ANSI-standard VDI graphics routines because (a) an implemenation of the ANSI VDI standard exists on the Unix micro I have (AT&T Unix PC) and (b) I thought that it might be possible to port the routines over to other computers for which there are ANSI VDI implementations, such as the Atari STs. I have written my own implementation of (some of) the ANSI VDI routines for PC-type computers, utilizing Microsoft's QuickC.

The ANSI VDI standard does have some shortcomings, however. At least as implemented on my machines, (a) it does not allow me to write to a buffer (from which I can blit portions of the buffer to the screen), and (b) its mouse functions (vrq_locator() and vsm_locator()) do not allow me to poll the mouse to see if a button has been pressed: vrq_locator() waits until a button has been pressed, and vsm_locator() (actually shuts down my Unix PC but) is only supposed to give the current mouse coordinates with no information about buttons pushed. Moreover, (c) I'd like to try the program running on a workstation, possibly with X or MGR.

This leads me to question whether I should try to re-port the graphics routines to another standard. But there are problems here, too. (a) It can be argued that X is an emerging standard, but of course I don't need the whole panoply of X (servers, clients, etc.) -- all I really need is routines for graphics manipulation (lines, points, fonts, etc.) and mouse handling. (b) A similar problem would exist with MGR, although it has the advantage (to me at least) of having been ported to the Unix PC. In either case (c) I suspect that I would have to rewrite a graphics library for PC style computers based on either X or MGR.

So -- is there a limited set of X or MGR graphics/mouse routines that could be implemented on PCs, allowing me also an easy way to port my application to other computers, especially workstations? I'd like very much to hear from you on this.

From: aimd@castle.ed.ac.uk
Message-ID: <3281@castle.ed.ac.uk>
Source record: 241730

I've just bought an STE. When I connected my hard drive to it all seemed to be going well for a while, then I realised my drive was being trashed as I was working! It was hopeless, the more I did, the more it trashed.

I re-connected the thing to my old ST (not a trivial task - it takes power from a leaad which must be connected to the ST's motherboard) but sure enough it really was trashed!

I put it back on my STE. I was a bit peeved at this point but I thought it'd at least give me a chance to re-format it with nice big partitions (TOS 1.4/6 can take bigger partitions that 16meg can't it?). Anyway I loaded up the format software (by GE-SOFT) and re-formatted, then re-partitioned. However no matter what I did it just wouldn't write any size of partition to the drive!

Back on to my STFM. Re-formatted, re-partitioned OK. My drive was up and running again!

Once again on to my STE. The drive autobooted, all partitions were there! So I saved a DESKTOP.INF file on the disk but to my horror it appeared as two rather random files taking up 11megs!

Can *anyone*, *anywhere* send me with a HD formatter that'll format a Seagate 157N drive, that works with the new TOS? I think it must be the format software that doesn't work, but I suppose it could be the driver software too (however, the drive is advertised as being STe compatible).

Eternal thanx,
-Mark.

From: aimd@castle.ed.ac.uk
Message-ID: <3282@castle.ed.ac.uk>
Source record: 241731

Hi, before my HD trashed I had written a program to re-vector the Timer B interrupt using XBTIMER. It worked OK but at the end of the interrupt routine I had to clear the service bit by simply clearing the correct bit in the MFP register.

Is that how it's meant to be done? I'm just looking for a cleaner way of doing it - isn't it possible that the address of the MFP chip may change at some time in the future. Is there a way of finding out these addresses without taking them out of a book? Or are all the IO registers high in memory guaranteed never to change?

Thanx again,
Mark.

>hard disks.) What does Apple have to lose by liscensing the Mac OS to
>Commodore and Atari?

What makes you think the rest of the world wants the Mac OS? If you want a unified operating system it would be much better to stick with UNIX. Contrary to popular belief UNIX does NOT require 4-8 meg of ram and 80+meg hard disks. (Especially if you leave out the on-line help.) I have seen very useable UNIX look-alikes (namely Minix) operate quite well on 1 meg machines (Atari 1040ST) with only 20 meg of the hard drive dedicated for it.

Even if you must reject UNIX, why should the unified OS be the Mac one? There are a number of reasons why people buy Amigas and Ataris instead of Macs. Here of some of them:

1. The Amiga or the Atari suits their given purpose better. Changing operating systems likely wouldn't affect this, so long as the hardware didn't change.

2. The Mac is expensive. If Mac liscenced their OS to Commodore and Atari, the Amigas and the STs would also become more expensive.

3. They don't like the Mac, hence they certainly don't want their Amiga or ST becoming more like it.

4. They don't like Apple Corp., hence they certainly won't want their purchase of an Amiga or ST to put money in the pockets of Apple.

(I won't tell you which one(s) of these were my reason(s)).

Of course some people would like the change - namely those who use their Atari or Amiga to emulate a Mac, but my opinion is that most people who want Macs purchase Macs, while those who want a computer to fill a given purpose(s) look more carefully and choose the computer which best fulfills their purpose(s).

Cross-posted to: comp.sys.amiga,comp.sys.atari.st,comp.sys.mac

I think the Mac has a great operating system. In my opinion it is the best, But it is far from flawless and I can see where many users that have special uses for their computers don't need it and may not want it.

Lets not forget that it wouldn't necessarily be good for Mac users. Every time Apple developes a new machine it has a bug fix release of system software to make it work. Example IIfx and system 6.05. Apple will have a difficult enough time in trying to develope system 7.0 that works on the plus, the IIfx and everything in between. Imagine trying to maintain and ensure compatibility for machines from many companies with each company having many models. I think we would have a stagnate unchanging operating system like DOS where the lowest common denominator was the driving force.

Any way One World , One OS brings back horror memories of pre 1984 when IBM and DOS where king. I think all computer users can agree that we are all better off because of the competition. Competition breeds inovation. One world, One OS would breed stagnation.

Ed

3543. SPECTRE GCR GOODIES

Newsgroup: comp.sys.atari.st
Date: 1990-04-14 19:07:48 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900414.13074410.031226@SFA.CP6>
Source record: 241737

This is a little long and Spectre GCR intensive. Page ahead if you are an 'ST only' computer user....

Greetings Spectre GCR users,

Some new toys have been released for the Mac which can be run on the ST. These are Grouch version 2.0, SoundMaster 1.4b2, and Cursor Animator 1.0b3 and can be found at LISTSERV@RICEVM1. All three go in the System folder and I'd kill for their availability for the "ST side". Grouch 2.0 animates the trashcan and needs to be doctored a bit before we can run it on our Spectre GCR. When you empty your trash, Oscar the Grouch lifts the lid and waves at you. He then returns to the can. On a real Mac, he sings, "I love it because it's trash." On the ST, we don't have the ability to play his SND song, but Oscar looks for the SND hardware anyway. This will lock up the Spectre. With ResEdit, operate on Oscar and cut out the SND resource. Oscar will now wave merrily to you when you dump your trash. Works PERFECTLY... By the way, if you have Sound Leech, you can pull the song out and save it for use in other toys. If you want Oscar to make noises, read the next paragraph.

IF YOU HAVE SYSTEM 6.0.4, then Oscar can sing to you, your ST can do hourly chimes, and icons/windows can sound off when they open and close via SoundMaster 1.4b2. 6.0.4 has some new routines, which, in spite of a rumor that continues to kick around, works great on the ST. (One little glitch with 6.0.4 and Spectre 2.65 is that toggling between a Mac 512e and a Mac Plus seems to be funny. KeyCaps indicates a toggle via the ALT/+ combo but doesn't seem to show when using the function key toggle via the help page. MacEnvy and Felix also don't see the toggle. Doesn't seem to affect my programs, though.)

SoundMaster 1.4b2 allows you to sound off with virtually ANY desktop function that you do, provided you are running System 6.0.4. My ST is giggling, growling, and chiming. Sort of unnerving. During the hour, the computer chimes the time--very distinquished. I have always wanted a Grandfather's clock, never could afford one. I have a real rich sounding digitized chime and one would think that the Grandfather's clock is in the room. GREAT!

A bug, or is it a feature, in SoundMaster will cause some frustration, even on a real Mac. When you set up your sounds, do not close up yet. With the SoundMaster window still open, click on the System Folder and look for a SoundMaster Settings file, if one exists. Delete it. When you close your SoundMaster window, a new settings file will be written. If an old one is there when you change your settings, then upon a new bootup, your settings will be done away with. OUCH... So, first open SoundMaster, then open the System Folder and delete the old settings file.

Another bug seems to exist on the STARTUP sound option. It hangs Spectre and also hangs some real Macs. Don't use it. In spite of

these bugs, SoundMaster is neat to use, especially for the trashcan. If STARTUP is real important to you, I'd bet that the older SoundMaster CDEV will not duke it out with the new one, if you select ONLY the STARTUP sound on the old one. Haven't tried that out. Run both and see what happens.
Cursor Animator 1.0b3 is really slick and I wish that we had it for the ST side. Imagine the busy bee on the ST replaced by any symbol that you want, and animated at that. Well, we have it for the Spectre GCR. Now, whenever the computer is busy, loading a file or whatever, I have my choice of many many animated cursors. There is a circling radar, a grid race, a grinder, and many more. I even created, via ResEdit, a scrolling Fuji and flashing Gadgets Logo cursor!!!
These are some really neat toys. I would send them to whomever wants them but our mainframe corrupts transmissions even on encoded files. They are available at LISTSERV@RICEVM1. ... and as usual, thanks to Dave Small for making Spectre GCR so compatible with the real thing.

3545. CX80 Trak-Ball modifications??

Newsgroup: comp.sys.atari.st
Date: 1990-04-14 20:16:32 UTC
From: longj@LONEX.RADC.AF.MIL
Message-ID: <9004142016.AA19513@lonex.radc.af.mil>
Source record: 241739

I know I once saw a file explaining how to modify an atari CX80 trackball so that it could replace the mouse on the ST on the net sometime last year. If someone has this information could you please E-mail it to me? I have seen two other text files for mouse-balls, but one dealt with the CX22 Atari trackball and the other was for a Wico trak-ball. This is the Older atari trackball that has two identical firing buttons. It is intended for the game machines. Please help, I am frustrated at having finally found one these gems, and now can't find the article!

3546. What I want to know is... (was One world, One CPU, One OS)

Newsgroup: comp.sys.atari.st
Date: 1990-04-14 21:41:40 UTC
From: demon@desire.wright.edu
Message-ID: <101.262752c4@desire.wright.edu>
Source record: 241740
Cross-posted to: comp.sys.mac,comp.sys.atari.st,comp.sys.amiga

Thanx for all the good input (and output)! I guess the gist of my post (which wasn't really as clear as I intended :) should have been "why can't these three companies come up with a common base operating system?" It wouldn't have to be Mac OS (I used that as an exampl), or any existing OS. With the MS-DOS world (ugh) breeding like rabbits, you'd think these three companies would be eager to increase the customer base for their products. The market for MS-DOS supports cheap clones, high priced clones and high priced IBM's. There's no reason to think the 68k world with a common OS wouldn't be the same. Already it is segmented into niches by cost and application. Price/power users with the Atari, multitasking/power with the Amiga and almost multitasking/(high priced) power with the Apple. I'm sure a lot of people go with Apple's because of the name, just like in the IBM world. Without a common OS, one (or two) of the current 68k lines will not be around in 5-7 years. We can argue about which machine is better, but that is not my point, all three lines are good machines or they wouldn't still be around. So, Apple, Atari, Commodore: why can't you get your act together for the benefit of your customers?
For myself, I'll be buying a 386 clone this year since I can get one with 1 meg ram, VGA display, 60 meg hard disk and 1.44 floppy for around $1600. You can't even buy a 2-floppy Mac SE for that price, much less a base Mac II. I could go with the ST or Amiga, but I use Mac's and DOS machines at work and WSU and have lots of software for these machines. So...because Apple is too shortsighted about their profit margins, they lose a customer. There are 3rd party programs that would let me run Mac or DOS software on ST's and Amigas, but working with software emulation is not what I want.
How about us as customers? What are the good points of the OS we use? What from other OS's would we like?
I'll start off by saying TRUE multitasking on the MAC.

Brett Kottmann
demon@wsu.bitnet

(P.S. thanx everyone for keeping this as a discussion and not a "my machine is great, yours sucks" thread.)

3547. Gemini 1.1 Docs in English

Newsgroup: comp.sys.atari.st
Date: 1990-04-14 23:56:52 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <776@ncs.dnd.ca>
Source record: 241741

I have translated the docs for Gemini 1.1 (Gemini, Venus and Mupfel) from German into English but will not post them unless:

a. There is interest

b. A few days go by without objection by the authors of Gemini.

It may be that they feel this would reduce the number of people ordering Gemini from them; I personally feel that understandable docs will acquaint more users with the program and increase the revenue. However, I don't even know if the release of the program was to the authors' liking. Not long ago one of them expressed his horror that a non-translated version should be distributed to North America and his surprise that version 1.0 had been released at all.

Any feedback would be welcome. PS docs include translation for clipbrd.doc.

3548. recent lharc v1.13 sources

Newsgroup: comp.sys.atari.st
Date: 1990-04-15 03:01:03 UTC
From: johna@van-bc.UUCP
Message-ID: <320@van-bc.UUCP>
Source record: 241742

I just got around to pulling apart some recently posted binaries and sources. One that got my attention was the lharc binary (not compressed). Despite being slower than any other compression program I've seen, it won my heart since it will compress files more than any other program that I have for the ST. And the sources were supplied too? Couldn't be better.

Unfortunately, it will not extract it's own source files. Lharc itself insists that there are no files in the archive. Two extraction programs, unlzh and lhxarc, find files, but since the directory separators are forward slashes (/) rather than the repugnant back slashes (\), the two programs just create (and overwrite several times) junk files.

Great, a simple problem that I could fix myself, if only I had the sources... Is it really that difficult to substitute \ for / while extracting and / for \ when archiving? An old unsharing program that I modified (and posted a long time ago) was able to do it, and if I can do it, anybody can.

Can I ask for a re-post of the sources (fixed or not) that can be extracted on an ST? Or does everybody in the world do all their extractions on *n*x?

Thanks

From: ncastellano@eagle.wesleyan.edu
Message-ID: <17256@eagle.wesleyan.edu>
Source record: 241743

I am interested in purchasing some parts for my Atari 1040ST, such as the connector which goes from the keyboard to the motherboard and an experimenter's card for the cartridge slot. If you know of any mail-order houses that carry ST parts, please mail me their address and relevant information (what parts they carry, prices if known.) Mail directly to me and I will summarize to the net. If a list of this information has already been compiled, would someone be kind enough to mail it to me?

Thanks in advance,
nick

> Shell knowing of it. Anyone have this problem?

Yes, I have this problem like all GEMINI users with software screen speeders may have. My workaround : Install the .T?? as an application with telling GEMINI to close its windows. No further messing-up, but the ouput still goes to the root window.

Another problem : .T?? programs always seem to write their output to the directory the program is in, NOT the one you have in your top window at your GEMINI desktop. GEMINI seems not to change the current dir like it does before launching .APP and .PRG files. Is there any setup I missed ? For now, I rename all .T?? files to .PRG with installing them as an application expecting parameters. But I think there should be antother solution.

3552. Severe Dcreate() bug in GEMDOS 0.23

Newsgroup: comp.sys.atari.st
Date: 1990-04-15 12:29:01 UTC
From: alderaan@tubopal.UUCP
Message-ID: <1371@opal.tubopal.UUCP>
Source record: 241746

Hi,

there seems to be a severe bug in GEMDOS 0.23's Dcreate() Call (TOS 1.{4,6}).
If you have a file with a given name somewhere on your disk and you create a
directory with the same name at the same path location, this Dcreate call
completes SUCCESSFUL ! This won't happen with the GEM desktop, because there
the existance of a file with the same pathname as requested for the new folder
is checked before calling GEMDOS. BUT, {GEMINI, gulam, NeoDesk?, ...} users,
please be careful !!!
Because of the successful Dcreate (), the file, however, will be clobbered
by this operation. Even the FAT will be consistent (clusters of the dead file
will be released correctly). No chance for recovery.

I'm going to patch this bug by telling GEMDOS to do the check itself. To
realize this, I have to write some reentrant GEMDOS code. Is there anybody
out there remembering the discussion about this subject several months ago ?
Someone posted a trick to make GEMDOS a bit :-) reentrant (if my memory
serves me right, something has to be added to the SP after each call) ...
Could someone repost this article or send it by mail (BITNET preferred) ?

Thanks -thomas

I think the fact that TOS/TTP programs under Gemini run in the current dir is a feature, not a bug. When I type arc v xxx, I dont want to have to type ~/xxx as a parameter.

This sounds like the trap handlers I posted a while back.

The "fix" I posted was a rewrite of the Bios and Xbios trap handlers
for use with Sozobon C. The specific use in my case was so I could call
Setscreen from a process termination handler, so that the screen would get
put back to normal regardless of how the program terminated (i.e., even
if an exception occurred).

I posted a GEMDOS trap handler too, but that was an unfortunate oversight
since (as several people pointed out) you can't call the GEMDOS from a
process termination handler.

In other words, the trap handlers were mostly a fix to Sozobon, not an
attempt to make the GEMDOS more reentrant.

3557. Quick ST demo problems

Newsgroup: comp.sys.atari.st
Date: 1990-04-15 16:51:26 UTC
From: clark@mshri.utoronto.ca
Message-ID: <9004151651.AA12525@lash.utcs.utoronto.ca>
Source record: 241551

I have the demo version of Quick ST 1.8 and am having problems with Flash, v1.51. About 90% of my ST time these days is spent in Flash, logged onto a VAX running VMS. The problem is that I get extra cursors dropped on the screen at various places. (They don't blink, but sit there as black rectangles.) It averages 1 - 2 per screen when I am reviewing text, such as reading mail, but get one between almost every word when editing with EDT. Is this a common problem, or is this something peculiar to my setup? I have a 520 STm, about 4 years old, upgraded to 1 meg, containing the following programs in the AUTO folder in the indicated order:

foldr100
fatspeed
pinhead13
spool (64K print spooler from the Abacus book Tricks'n'Tips)
universe (Universal Item Selector I)
maccel2 (mouse accelerator and screen blanker from Atari)
quickstm
quickstc
startgem (for Neodesk)
clkset

At the recent Toronto Atrai Confederation show I spoke to someone at the Branch Always booth (the people who make Quick ST) describing this problem that I had had with an earlier version of their then shareware demo. He assured me that the problem of dropping decoy cursors had been fixed. It just makes me wonder...

Source record: 241553

AS an Internet uswer I'm not sure if my input means anything because of the differences in the way Usenet and Internet operate.

However, I would like to vote for keeping everything in one newsgroup. I find that the volume of material that I have to dredge through to extract useful nuggets is not unduly large. It is true that we get quite a lot of nonsense on some topics. It is, however, easy enough to cut some of it off by sending the offender a nastygram directly if he gets too obstreperous.

In any scheme that is devised there will be a certain number of sociopaths who will clutter up bandwidth for the sake of seeing their names in print.

The people who are sensitive to the bandwidth issue (such as Steve Grimm) are perhaps being overly tender on the subject. I think the people who run the nets (MILnet, NSFNET, etc) know what is going on and are willing to accept a certain amount of wasted verbiage in exchange for a modest amount of solid communication. It seems tru that the Atari newsgroup does a disproportionate amount of verballizing, but the occasional offender seems to lose interest fairly quickly. There is a solid core of people who get real value from the exchanges and, if we err on any side I think it should be on the side of excess information rather than shortage.

3562. Phantom Typist

Newsgroup: comp.sys.atari.st
Date: 1990-04-16 12:34:17 UTC
From: rick@jhunix.HCF.JHU.EDU
Message-ID: <4797@jhunix.HCF.JHU.EDU>
Source record: 241556

I don't know if anyone is still following the Phantom Typist thing, but for the first time in four years of Atari ownership, without changing my usual software habits in the least for at least 6 mos, I managed to get it to show it's ugly head (OK, it showed it's ugly head of its own free will).

The interesting thing is that I know exactly what I did differently, and this definitely suggests a solution. I was feeling too lazy to use the mouse, so I went flipping through folders, then around the menu bar of Word Writer 2 using the Alt-arrow keys. Didn't take long before the thing started to go bezerk. I also noticed that although the keys weren't responding right, the last two or three characters I typed would appear if I wiggled the mouse.

Anybody come to any conclusions on this thing? Or is the general consensus that this is a dead issue?

Eric

Yes, but then we won't meet anyone new ;-) since programs (for the Amiga) are out than can convert between Messy-Dos and Amiga and MacNTras---ahem, Macintosh ;-) it's only logical (when was business ever that way? ;-) that different systems, ie IBM PS/200 Atari XZ Mac iiYZ and Amiga300,000 will eventually have file formats close enough, or the same, while retaining their own distinctive (sometimes infamous ;-) features.
keep hoping, but only for file formats ;-)

I like Stalker because it works with VSH and lets me have several MT C-Shell command windows and my analog clock and my load monitor graph accessories all running at the same time while I'm logged in someplace.

Stalker has minimal ANSI support and the latest version has a little bit more VT-100 attribute stuff. I tell my Unix system that Stalker is a VT-100 and it works, but not all the "pretty" stuff works.

It has a big buffer so 19.2 would probably work, but no GEM based terminal is going to really "keep up" at 19.2 because there is no way to draw characters into a GEM window legally as a well-behaved desk accessory at 19.2 K baud.

3568. Overscan in 60 hertz and Multisync Monitors.

Newsgroup: comp.sys.atari.st
Date: 1990-04-16 19:20:55 UTC
From: mrose@libserv1.ic.sunysb.edu
Message-ID: <7731@sbcs.sunysb.edu>
Source record: 241563

A friend of mine recently did the Overscan mod to his Mega, and I was wondering if there is a new version (we have 1.6) that will work in 60 hertz so our screens won't flicker. Also, does anybody know of a good and cheap multisync that would work well with Overscan, what should the maximum resolution of the monitor be? We would like to use the monitor in color and mono. Does anyone have that video50.prg that was supposed to come with Overscan? It was not in the archive on terminator, if someone does have it, could they send it to me and any new information on Overscan. Thanks alot!

>there seems to be a severe bug in GEMDOS 0.23's Dcreate() Call (TOS 1.{4,6}).
>If you have a file with a given name somewhere on your disk and you create a
>directory with the same name at the same path location, this Dcreate call
>completes SUCCESSFUL!

I can't make this happen.

```
#include <osbind.h>
main()
{
int fd;
long err;

fd = Fcreate("silly",0);
Fclose(fd);
err = Dcreate("silly");
printf("err is %ld\n",err);
exit(0);
}
```

prints "err is -36" (EACCDN, access denied). I'm using TOS 1.4's GEMDOS.

Funny, I just ftp'd Uniterm 2.0e 011 from tukki.jyu.fi.
And it doesn't work properly, namely the YMODEM downloading
acts strange. I was much happier with the 002 version I had.

In article <1990Apr14.155106.2692@watdragon.waterloo.edu> swklassen@tiger.waterloo.edu (Steven W. Klassen) writes:

Contrary to popular belief UNIX does NOT require 4-8 meg of ram and 80+meg hard disks. (Especially if you leave out the on-line help.) I have seen very useable UNIX look-alikes (namely Minix) operate quite well on 1 meg machines (Atari 1040ST) with only 20 meg of the hard drive dedicated for it.

Ho hum. I've seen _real_ Unix run on smaller machines - 256K and a 10 meg disk. I've seen clones run on _much_ smaller machines - say 32K and a single floppy.

The problem with all these is that they are v6 or v7 Eunices, not anything modern. Missing things like process control, networking, modern tty drivers, windowing systems, etc. Adding those things adds a lot to the size of the system. Worse yet, adding the necessary parts to the kernel to support those things adds a lot to it's complexity. That's why the clones tend to be v7-oid clones, and not 4.3 or Vr4 clones.

Of course, you _can_ run a full-fledged, modern Unix system in 1 meg of real memory and 20 meg of disk (but not the 256K version I used to run on PDP 11s). However, you won't be very happy. The kernel will probably run 300K or more; leaving 700K of real memory for your applications. The window system server eats up about as much space as the kernel, and simple applications about 2/3rds that. In other words, you're going to have trouble getting the kernel, window manager & two terminal windows in memory. Now add a large application (emacs, or a postscript previewer, or some such), and your system is going to be going to the disk a lot. Not much fun. But you probably don't have a windowing system, as the X11R4 binary distribution is ~40Meg, not including most of the user-contributed software.

The 4-8meg/80meg of disk claim isn't a minimum to run Unix; it's a minimum to provide the kind of environment that Amiga users are used to (I don't know the Atari, so I don't know what users are used to; I don't think an off-the-shelf Unix system is capable of providing the kind of environment that Mac users are used to, unless it's from Apple). But unless you are a rabid Unix fan, you probably aren't willing to give up windowing and multiple shells and the like just to get Unix.

I'd be glad to have a counterexample. A fully functional Unix system, complete with window manager, SLIP, UUCP, cron daemon, and the ability

to provide reasonable perforamance to both an editor, a terminal and multiple trivial applications (xsnap, xclipboard, xwd and xmessage, for isntance) at the same time as all the above are running (hint: choose something with shared libraries - they help a lot!). Make it all fit in 1 or 2 meg of memory, and run from 30 meg of disk (that seems to be the new "smallest" disk).

From: davemc@rtech.Ingres.COM
Message-ID: <5260@rtech.Ingres.COM>
Source record: 241567

Hi,

As a new owner of an Atari ST, I've got a few questions:

1) (of major concern (-:) to justify the expense, I need to find a copy
of Adventure (yeah, the old text only adventure game). Anyone got a suggestion?

2) My company uses Mac's for almost everything (except Email). Could
someone provide me a comparison of MAC emulators and/or point me to
such a beastie? (I bought an Atari because I prefer it; I'd like to
cross my files over (particularly things created in POWERPOINT) for work.)

3) Is anyone aware of a DISPLAY POSTSCRIPT type of program for Atari?

Thanks for the help. While I can talk Unix and VMS all day, I am definitely
not Atari literate (yet). I promise to educate myself as fast as possible,
with ya'll help.

Source record: 241568

(Sorry if this is a resend but i'm not sure is my mailer works)

I've been hearing a lot about SIMMS chips. That it might be relatively easy to install and use for ST memory. Just realizing that 1 meg simms chips can be picked up for around $60 (U.S.) as opposed to 8-1meg dram chips for 8*$10 hints at their usefulness. The point i am getting arround to is: Just how easy are these thing's to install?
I would also like for someone to mail/post the pinouts of a 1 meg simms chip.

Good choice. Best hundred bucks I have spent.

>
> 2. Double-side floppy drive (yes, I'm suffering with a single,
> single-sided drive - Master 3S from Konyo International.

I would try to verify that the drive can format out to 85 tracks. You
would probably never want to do it, but the 82 track/10 sector twisted
format is nice. Beware of drives that make a funny click when reading
past track 80. Also, you might want to check out the Blitz cable copier.
It should work with one single and one double sided (you could probably
only copy single sided disks, but it's better than making it an ashtray).

>
> 3. C compiler, etc. - Megamax Laser C and Laser source debugger.

You might wish to try one of the PD offerings: Sozobon and GNU C. They
might not work on a 520 though. Also, Prospero C is ANSI standard, and
they are really good about supporting their stuff. Were I in your position,
I would probably expand memory to 2.5 megs and give myself the option of
using Sozobon or Gnu C. The extra memory is really nice, I have a Mega2ST
and could not imagine not having at least 2 megs on an ST! If I could find
a really reliable way to do it, I would expand to 4 megs in a second.

|> rather than the screen? I can't seem to get this one........

You can use io redirection, e. g. "zoo l foo.zoo >bar" writes the table of contents of foo.zoo to the file bar.

If your shell (or the GEM desktop) does not handle io redirection correctly (I think Gulam doesn't) use Arcgsh to get the listing. It works.

The Phantom Typist is surely not dead. It struck me several times in the past years using 1st Word Plus.

Last week he appeared while I was using Laser C with his usual symtoms: I typed quickly in the Laser C editor (yes, I'm still working on Arcgsh), then the last few keys slowly reappeared on the screen. I recognized the Phantom Typist immediately and was able to save my edited file. It was astonishing that the Laser C shell did not not crash then throwing bombs. I was even able to continue working (exit Laser C, restart it etc.). However, the reaction of the ST to mouse clicks and keyboard typing continued to be very slow with a response time of about five seconds or so. (I am using TOS 1.4.)

3583. New GDOS

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 14:20:50 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <2987@rodan.acs.syr.edu>
Source record: 241579

I just read in the April 1990 issue of Current Notes (this is in the ST Update article) that Atari will be releasing a new version of GDOS...The article on page 11 says that "Atari is totally redoing GDOS and may issue it as soon as this summer." I was just wondering if anybody knows anything about this, and/or what are the ramifications of a new GDOS? For example, I was hoping to buy G+Plus soon...but should I wait for a new version that is will be more like the newer version of GDOS? Will programs that use GDOS now, e.g. WordUp, be able to handle the new GDOS?

I guess the stock answer to some of these questions would be: If the new GDOS is compatible with the original, and if programs handle the current GDOS in a "legal" manner, then everything will be OK. But are there other things to consider?...I just don't know that much about these things.

If this has already been discussed extensively, I guess there's no need to post to the net, and you can email me directly. Otherwise, posting to the net will be just fine.

One last thing...notice that this is the April issue of CN...is there any possibility that this is an April-fool type thing. I am being serious when I say I have no idea...it is so hard to tell what is going when it comes to matters like this. Thanks.

> Commodore and Atari?

Well, I think there are also some other OS that are worth considering.
For example I'd like to mention OS-9/68000. OS-9 is a small but
efficient OS, with many Unix-like features like multitasking/multiuser.
And OS-9 doesn't need much memory (the Kernel has only 25680 bytes).
Many Unix-utilities have been ported (if PD) or been rewritten for
OS-9, and many sources from comp.sources.unix can be compiled with
minor changes. So, OS-9/68k is the OS if you want to have a good
multitasking OS for your 68000 CPU. To mention some programs I got
running under OS-9: uucp (uupc), news, NN (newsreader), notes,
nethack 3pl7, conquer, (u)larn, moria, omega etc.
(I really do like playing rogue style games :)

Cheers,
Frank

3586. Welcome to comp.sys.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 16:01:00 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1990Apr17.162032.28368@cs.umn.edu>
Source record: 241585

```
Last update: 17 April 1990
Author: David Paschall-Zimbel (davidli@simvax.labmed.umn.edu)
Comments and suggestions welcome.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have little
desire to read about that neat bit of [hard/soft]ware you're selling when you
live in the U.S.A. If you don't know how to restrict distribution of a posting,
ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this
article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?
=================================================

There is an FTP source and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

For anonymous FTP: terminator.cc.umich.edu [35.1.33.8]

User anonymous
<enter password>
```

cd /atari

Most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For the panarthea mail server, see Steven Grimm's monthly posting. Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May, that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==========
OK (no error).....0
Fundamental error.....1
Drive not ready.....2
Unknown command.....3
CRC error.....4
Bad request.....5
Seek error.....6

Where can I get copies of ST Report and ZNET?
==========

ST Report and ZNET on-line magazines are available on CompuServe and GEnie.
You can also get copies mailed to you by sending an e-mail message to

streport-request@virginia.edu

indicating which one(s) you wish to receive.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of
the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

==========

This is the 'first run' of 'Welcome to comp.sys.atari.st'. I would appreciate
feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach
me at the following:

3587. Info request on rumoured TT

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 16:17:07 UTC
From: mseidle@bsu-cs.bsu.edu
Message-ID: <11081@bsu-cs.bsu.edu>
Source record: 241580

Well, whats this Atari TT buisiness I keep hearing about ?
I hear that it runs Unix (if so who's and what ver), has vga equivilent
graphics, and is dirt cheap. Could some one fill me in on this beast
before I loose my cool and go out and buy an Amiga ?

Thanks in advance

mike

3588. Atari ST->MAC->IBM compatibility

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 16:30:24 UTC
From: mrsmart@bucc2.UUCP
Message-ID: <56200004@bucc2>
Source record: 241581

I am considering buying a new computer this summer (I have an Atari 400 now).

I would like to know exactly how compatible you can make an ST
with Macintosh and/or IBM. I know it is possible to run some
softwares, but exactly what can and cannot you do with the
emulators. Also, I plan to go shopping in the Chicagoland area,
and where would be the best place to go looking for an entire
ST system at good prices.

Thanks......

3591. Advice to Spectre GCR owners

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 16:38:34 UTC
From: zimm@portia.Stanford.EDU
Message-ID: <11272@portia.Stanford.EDU>
Source record: 241588

The Spectre GCR manual never makes it clear whether or not one can get
away with using the "Shutdown" menu option in Mac mode (versus just ejecting
the disks).
My advice: DON'T DO IT! I tried it *once* and now my hard drive
is garbled. (Yes, I'm using the new release of the Spectre software. Perhaps
the older software works better.)

You have been warned!

Source record: 241589

I don't type fast enough to see this fellow regularly, but I have a suggestion for any registered developer out there who does. Make a habit of running programs that run into the 'phantom typist' under Atari's db debugger, WITH A STOP BUTTON SET UP (does any other debugger allow external events to break programs too?). Next time you see him, push the button and start tracing. How's that sound?
Steve J.

Wrong. The Spectre GCR manual very clearly states that although selecting shutdown appears to work you should ALWAYS select all disks and eject them (control-A control-E) to guarentee that the directory information is correctly updated before you shut down. It is obviously important to read the entire Spectre manual!

Uhm. Maybe your C library does the Fsfirst ? On MY machine, I could make this happen with a clean floppy disk (no HD boot, no ACCs, no Auto folder) and a CLI on it. I've got the german TOS chip set, is there a difference ?

For those who discover the same problem I have, please could you put your two cents in ? The patch, however, is running already and solving the problem on my ST. If there is a need, I'll post it.

3599. Re: Info request on rumoured TT

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 20:45:51 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Apr17.204551.12462@chinet.chi.il.us>
Source record: 241596

I don't know how reasonable this is as a possibility. What I do know is that Mark Williams Company is selling their UNIX clone, 'Coherent', for the Intel chip-based market right now, and that they have nothing fundamentally against the Atari ST market, they just don't find it big enough to make very much effort financially worthwhile. The natural question is whether there's a reasonable way to induce Mark Williams Company to do a version of Coherent which would run on both STs and TTs. If nothing else, it would be a nice development platform for both machines. At best, it might become the standard character-based UNIXoid for the TT. (If you'd trust version 1.0 of an Atari labelled UNIX more than the first ST port of Coherent, _____...(That means fill in the blank)). The key questions are how many copies could they sell for the ST, how long would it be before Atari's UNIX (presumably with GUI) became more attractive on the TT, and (presuming that the true answers would justify a release of Coherent), how do we get the message out?
Steve J.

Shutdown does a 'reset' instruction amoung other things.

What probably happened is that you had the HFS filesystem on the HD in a bad
state and now its damaged.

This brings out a bigger caution. MAC buffers the data to the Filesystem,
and 'eject' is the only way to guarantee all the info is written out.
One will think that resetting the Atari is OK, because most of the time
the Filesystem is being read. But, change something, and look out.

In the MAC world there are several file system repair programs. Most seem
to bypass enough of the MAC OS to kill Spectre also.

Does anyone have a file system repair utility that will run under Spectre?
How about one that runs under TOS and knows how to fix MAC partitins?

Hmmm... is that what I just found?

Example:
Run megaroids.prg :) and use the alt-cursor keys to maneuver the mouse
pointer. Select menu item "Start" and then press and hold down alt...
press and hold down insert.

It is quite annoying. I just turned the machine off!

The AT&T UNIX-PC 7300 was originally introduced around 1984 with 512K RAM and a 10MB disk. It was stripped down pretty much but it was real UNIX and had its own proprietary bitmapped windowing system and mouse/keyboard oriented shell.

>The problem with all these is that they are v6 or v7 Eunices, not
>anything modern. Missing things like process control, networking,
>modern tty drivers, windowing systems, etc. Adding those things adds a

No, the AT&T 7300 and 3B1 both run a version of System V somewhere between Vr2 and Vr3....

>Not much fun. But you probably don't have a
>windowing system, as the X11R4 binary distribution is ~40Meg, not
>including most of the user-contributed software.

Yes, X is big, but there are other alternatives. Read unix-pc.general and comp.sys.att for discussions of the MGR port to the 3B1 which gives lots of the same functionality in a fraction of the space...

>I'd be glad to have a counterexample. A fully functional Unix system,

>choose something with shared libraries - they help a lot!). Make it
>all fit in 1 or 2 meg of memory, and run from 30 meg of disk (that
>seems to be the new "smallest" disk).

I have a 3B1 which I got for $2100 new during the big "fire sale" which AT&T had a couple years ago to clean out their inventory. You can buy them used now for $1500, including development set software. The stock 3B1 has a 67 MB disk and 2 MB RAM, 10 Mhz 68010 CPU, demand-paged virtual memory, internal 1200 baud modem, 400 K 5.25 disk, etc.

There has been lots of talk about porting X to the 3B1, but it hasn't been done yet. Windowing on the bitmapped screen is built into the system (via kernel and window driver), but is not really ideal. Anyway, this

machine runs quite respectably, even with 3 users. I have lots of public domain sources and binaries online, several MB of man pages, run a bulletin board, carry about 6 or 7 MB of usenet news, have 4 UUCP neighbors, 5 MB swap space and still have about 30 MB free on my 67 MB disk. Yes, it does make effective use of shared libraries to keep binaries small too.

I know others with 1 MB RAM and 20 MB disks that still make productive use of their machines. Dave Bozak's cleo.oswego.edu is a 1MB/20MB 7300 with an ethernet card here on the internet, for example.

With this kind of hardware available for such a reasonable price, why not just buy a 3B1 for your UNIX needs and use your Amiga, Atari and or Mac for your other needs; that's what I do.

3605. Spelling checkers? (PD or otherwise)

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 21:36:07 UTC
From: apratt@atari.UUCP
Message-ID: <2150@atari.UUCP>
Source record: 241598

I'm looking for recommendations on a spelling checker for the ST. I want a stand-alone program, not one built into a word processor. It should take an ASCII file as input and produce an output file (or redirectable standard output) consisting of the list of misspelled words, or something equally generic. If it's PD or shareware, all the better.

Please reply by mail, not by posting, and I'll post a summary of replies. Thanks.

3606. World ST penpals list (5th posting)

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 21:39:17 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9004180709.AA23384@ucbvax.Berkeley.EDU>
Source record: 241615

To *ALL* Atari ST owners worldwide!

Are you interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not got network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime). I am working now on a list for the UK and when both lists are complete I will Email a copy to everyone that wants one.

I hope that this generates a reasonable level of interest, so don't be shy! Contact me sooner rather than later and lets all keep in touch! :-)

Regards,

Simon

3607. UUDecode

Newsgroup: comp.sys.atari.st
Date: 1990-04-17 21:39:31 UTC
From: anw1@ukc.ac.uk
Message-ID: <2927@gos.ukc.ac.uk>
Source record: 241595

I dont know if I am missing something obvious here,but....

I have found a piece of PD software I would like, and have FTP'd it to
my machine, where I find it is over 700KBytes in size.

Now when I UUDecode this file it produces another output file of similar
magnitude, thus there is not enough room for it on a 3.5" disk.

Is there any way around this problem, can you hack the file into pieces
and then somehow rejoin them later, or is the only solution to get a hard
drive?

Any help greatly appreciated.

Adrian

Netters,

As many of you may now have realised, I am in the process of trying to construct a list of ST users around the world, so that those of us who will soon have no Email access can still keep in touch!

On this point I would like to ask all those who have posted to me asking to join the list to repost to me if they have not received a copy of the list to this date (17th April 1990) as I have just distributed an updated version!

All other volunteers to join the list are, of course, welcome!

Regards,

Simon.

3610. Drive Probs

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 00:03:45 UTC
From: cr1@beach.cis.ufl.edu
Message-ID: <22917@uflorida.cis.ufl.EDU>
Source record: 241597

I'm having a small drive problem. I'm no techy or anything, but I happen to have a multimeter and went at it. Symptoms: ST either will not boot at all with the 2nd drive hooked up or will only run boot sector code and auto folder programs before it seems to have problems reading the drive. eventually it 'slow boots' to the desktop. I flipped over the st and checked 14 solder points directly under the drive port. It went something like this...

```
11 9 14 8 10
5 13 12 4
7 ? 1 2,6 ?
```

The numbers coincide with the pin number. You'll notice that the two question marks do not seem to go to any of the pins, and that 2 and 6 both seem to go to the same place. Also, I could not find pin 3 anywhere. Does this look right?

Hello All,

I've been asked for help in regards to Minit933,but since I don't use VT-100,I hope you don't mind a few questions.

1)The problem encountered is dialing out from within the prg itself,so is minit933 a stand alone terminal or does it have to be called from within a terminal prg.(such as Flash,Interlink,etc)?

2)If it is a stand alone prg,how is the dialing accomplished(apparently the docs were a bit on the lean side)?

Please Email so we don't waste more bandwidth than necessary.

Thanks in advance for your help,
Kent Cavaghan

3613. Upgrading memory and color...STE color changer anyone?

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 01:20:34 UTC
From: cr1@beach.cis.ufl.edu
Message-ID: <22920@uflorida.cis.ufl.EDU>
Source record: 241609

Hi all,

I am in the process of upgrading my memory and color on my ST using a John Russel Innovations board. It uses SIMMS, and for 25 extra dollars lets me expand to 4096 colors. I can't tell you how it works right now, because my MMU will only handle 1 meg of memory and I am waiting for another MMU to come. Needless to say, I am having some memory problems at the moment since I have 2.5 megs and my mmu insists I have 1 meg. Ramdisks tend to garble data...Revolver just refuses to work at all...does anyone else have a JRI board?

To get to the point, I am curious to see if an STE color palatte accessory will work with my color upgrade. Could someone possible uuencode me one and mail it, or point me to an FTP site that has one available? I assume that such a thing is PD, of course...I can't imagine it being otherwise.

Here's a question for Alan Pratt or someone else working at Atari, My local atari dealer had a real problem getting an MMU for me that could handle the extra memory. Is there a shortage of MMU's out there or is some distributor just yanking his chain?

(OH , as a side note, the colors work real nice. It is compatible with Space Ace, had some nice scenes in there. Not trying to promote the product or anything, just letting you know. If anyone is interested in hearing a full report on the board, send me mail and I'll write up a detail on what I think of it...I'll even post it if there is enough response...)

3619. Bug in CSD, no help from MWC

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 04:35:53 UTC
From: nims@accuvax.nwu.edu
Message-ID: <6479@accuvax.nwu.edu>
Source record: 241604

About two weeks ago, I purchased Mark Williams C, and the C source debugger. I am very pleased with the compiler. I have unfortunately found a bug in the debugger. It does not correctly display negative integers. Insead, it treats them as unsigned ints. (e.g. -10 is displayed as 65526.) Althought this isn't too diffcult to work around, it is a bit annoying. So I resolved to call Mark Williams Co. this morning, and I must admit that I'm not too thrilled to report my findings. The gentleman I spoke to was very quick to point out that since Ataris aren't selling, they are not doing any further ST development and since they are "in this for the money," they aren't planning any more ST development. Basically, he was telling me that I'm out of luck, there aren't and probably won't be any future version of the CSD even to correct bugs. I must admit that I feel they should at least support this product to the point that it lives up to it's claims in the advertisements. Don't get me wrong, for $35 this is a good tool, I just wish I could expect the bugs to be worked out.

Is there a program (perhaps of then AUTO folder variety) that can autoload
one of the alternate mouse pointers at bootup? I have Mouse-Ka-Mania, but
was disappointed that it seems to only be a stand alone type of thing. If
one could alter the standard desktop mouse easily, that would be most cool.

What is the name of the file? I have never come across that problem, but
one possible solution (temporary) would be to arc the file on the host
machine, and then run it from arc on your ST. I have heard this is
possible, but I have never done it.

Yikes! And this from the maker of the Atari-Developer-Reccomended
C compiler! This is really spooky. If Mark Williams is not doing
any further development or bug fixes on thier Atari products then
one should DEFINATELY look into other vendor's products. NASTY
RUMOR ALERT: Did I hear somewhere that Laser C ANSI is under
development? I thought I did... (was it here? <blush>)

For the record, I also looked around and decided to buy a Z-RAM
memory board & chips for a 2.5 meg 1040. The board was a dream to
install--though I don't get simms. GNU C is great. Tho I
haven't gotten it to link with the -g flag for the debugger yet.

> Is there another way?

Of course:

1. Ignore the problem.
2. Write a stand-alone auto folder utility for those people who REALLY
need such things.
3. Add a 'save desktop.inf' option to an already existing DA (as I did
for my harddisk software).

By the way: what about 'patching' CBHD and calling it CBHD 3.6??? This
would be the same thing Claus did to Allan Pratt and his Poolfix...

3625. Atari USA and TOS1.4

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 07:47:56 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGQCDCFVBXXN.at.UMPA>
Source record: 241600

To anyone at Atari USA - Can you tell me why Atari UK are so slow in releasing TOS 1.4 ?
I and a number of friends have seen comments flying around on the nets for months now but still nothing seems to be happening in the old UK.

Anyone else have any ideas how to get it - would a 'non-UK' version work ie. could I mail order one from a supplier in the states?

Does anyone know i) where to get a copy of Gemini 1.1 and ii) if it works with the old version of TOS in my Mega - a friends got a new STe and we had a quick play with version 1.0 - very nice, especially the movement of the dialog boxes using the blitter. My it almost made my wish I had a blitter in my Mega - whatever happened to the blitters that Megas were meant to have in them?

3626. shareware fees

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 08:33:33 UTC
From: U635007@HNYKUN11.BITNET
Message-ID: <9004190702.AA14142@ucbvax.Berkeley.EDU>
Source record: 241601

I'm thinking of releasing a chess program but I'm in doubt whether to release it as Public Domain or as Shareware. Reasons for these doubts are that I've no idea what to expect from the response to shareware programs ie. what (if any) the revenues will be. I think it will depend on the amount charged and since I don't intend to charge more than say fl.15,- (15DM / 8$) (I've seen fees as high as 60DM/ 30$! but hey, I don't want to make a living out of it) I might release it as PD when responses are low. So here's the question:

-) do any of you people have experience with releasing shareware ?
-) what's the response?
-) how much did you ask for and how much did get? (If you're afraid the people of the income tax are listening in you might leave out the currency unit (if asked, you might claim it were italian lires... :-)))

Thanks in advance, M.

Why not just decode it on the host machine? If it doesn't have
uudecode, then just port uud, for which portable source coude is readily
available (from me, for example).

3631. Proposed change to names of sources/binaries postings

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 13:18:44 UTC
From: vj@cxa.daresbury.ac.UK
Message-ID: <12406.9004181318@cxa.daresbury.ac.uk>
Source record: 241613

If it's script posting time... I read all my mail using GNU EMACS in its RMAIL mode. Here is what I've put in for extracting uue encoded things. It puts them in the directory specified by the variable usenet-archive-root. Once all the parts have been extracted, I run uud on the first one, and it then find all the continuations itself - providing the filenames are correct. To get the correct filenames, they are made from the names in the begin line of the uue(ncode) stuff - the proposed name changes don't do anything to this, but may have made writing it a little easier had they been done before. If anyone is interested I can also mail them a copy of the undigest code for GNU EMACS - I didn't write that one, but use it all the time.

I think that if I had to vote on the name change, I'd say yes, change them. By the way, thanks to Steven Grimm for all the work he puts into this.

Enjoy,

Dave Hines.

I've gotten lots of input on my question about C, floppies, and modems. I'll summarize it in a few more days.

Amid considerable praise for the Supra modem (including quotes in their ad in the May STart), one voice was very unhappy for what sounded like legitimate reasons. Can anyone comment on these problems?

1. Bad line noise recovery, loses sync with remote modem and has trouble regaining it.

2. /A command to redial forgets phone number when connection succeeds, so you can't redial after a disconnect.

Thanks,

Bob

How to instruct Arcgsh to write the output of Zoo to a file instead of the screen: Click on "Filenames..." in the main Zoo dialog box, then select a file as "Standard output".

One way is to try to expand it on your friendly UNIX computer. I have a binary
of arc that runs somewhat on a Vaxen.
Or, find a ST user with a Hard Disk.

It is easy for a poster to forget that a Hard Disk can hold files much
too large for floppy. It is very easy to make an Archieve that is too big.
This is probably what happened here. Hopefully your plight will get other
poster to consider what happens if an arc expands >360K.

3635. Re: Acc DTA Malloc AES

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 14:27:47 UTC
From: micro@imada.dk
Message-ID: <734@imada.dk>
Source record: 241629

Dear Atarians;
I am have here the extract of the anwsers to my questions
concerning ACCs, the DTA and malloc:

- 'fsel_input' can be used without setting the DTA.
- the size of a file can be found by searching to the end of the
file.
- you can use the 'Fsfirst'/'Fsnext' from Accs, by saving the old
DTA, and then setting your own. Please read letter two...
- 'Malloc' can't be used from Accs as they are *second class*
processes, mainly because they don't have a base page.
This is also the reason why 'Pexec' is rather *unstable* from
accs. Please read letter one...

The two letters following, are answers to :
sgstree@relay.EU.net (Samuel Streeper)
both have been send during the easter, but I keep getting a "User
unknown", when I try to send them.

Programs have been tested on my MEGA2 w. tos1.4, my brothers STE
w. tos1.6 and my girlfriends MEGA1 w. german tos1.2. (I don't have
access to an Atari with tos1.0).

********** LETTER ONE **********

Thank you for answering my questions. I really need to malloc, as
I am making a text editor.
It is not really an editor yet, which is why I call it "more". I
have not implemented *all* features of the famous "more" - really it
can only open and view files - no fancy stuff at all.
The only way to avoid malloc is to make a combined ramdisc and
editor. This will of course not solve the problem of having a very
large chunk of unused memory, but it will be more easy to justify (as
many people are using a large fixed size ramdisc, for various
reasons, of which the least is not the lack of a fixed-multi-
megabyte-device.

I have experimented with the 'active_process'-pointer, and I have
found that it can be used to get the ownership of malloced memory,
and to get a private DTA.
When using malloc or Fsfirst/Fsnext simply let the
'active_process' point to the basepage of the acc. It works and why
shouldn't it? - Malloc uses the pointer to stamp the memory blocks,
and Basepage allways points to the DTA of choice.

It really works with both 'Fsfirst' and 'Malloc'.

I use the following code :

```
/****************************************/
/* Hacks to do what allready is possible */
/****************************************/
extern SYSHDR *Sysbase;
extern BASPAG *_BasPag;
BASPAG *OldPD;

void UseMyBase(void)
{
OldPD = *Sysbase->_run;
*Sysbase->_run = _BasPag;
}

void UseOldBase(void)
{
*Sysbase->_run = OldPD;
}
```

It is very simple to use, the DTA has to be set one time only:

```
main()
{
...
UseMyBase();
Fsetdta(&FileInfo);
UseOldBase();
...
}
```

And here is the interesting part of the 'open file' :

```
if (FileSelect(TextPath))
{ UseMyBase();
Err = Fsfirst(TextPath, 0);
... (no AES calls) ...
Text.Document = Malloc( FileInfo.d_length + Epsilon );
UseOldBase();
...
}
```

I didn't want to reenvent the wheel, but I think I just have...
-don't tell me nobody have ever tried to do this before.
There will be problems if the dispatcher ever runs on a different
scheme (say time sliced). If that ever happens this hack will be in
deep trouble (and so will your suggestion about saving DTA, setting,
using and restoring it)

```
old = Fgetdta();
Fsetdta(new);
... do funny things ...
/* if the dispatcher ever runs here, there will be trouble -
the sky will spit fire, the earth will open and file
```

```
searches will fail...
*/
Fsetdta(old);
```

However, notice that if the dispatcher was common to both the AES and GEMDOS there would be no trouble (as there is now). The dispatcher only needs to update the 'Active_Process' (of GEMDOS fame), so that it _always_ points to the basepage of the running process.
As to my experiment with AC_CLOSE :

```
> case AC_CLOSE:
> Cconws("acc closed");
> Cconin();
> form_alert(1,"[1][|Closed][OK]");
> break;
```

What happened was that "acc closed" appeared on the screen before the application had terminated!, then the desktop was opened (lots of AES calls), and then the alert box "closed".
It appears that there is a fixed number of 'free' AES calls, just after the application is started, and that the dispatcher runs before AES calls. More interesting it seems that some programs uses the AES _after_ 'Pterm'! - handy to close windows and restore the desktree - with the 'etv_term' vektor I guess. This has the added bonus that windows are closed and the desktree gets restored - even when the program terminates abnormal (with those cute bombs).

Please let me hear any comments

-micro@imada.dk (Klaus Pedersen).

********** LETTER TWO **********

What a bummer, Sorry.

In my last letter I wrote :
```
> More interesting it seems that some programs uses the AES
>_after_ 'Pterm'!
```

What a bummer - as it is 'appl_exit' that sends the 'AC_CLOSE' message, the only way to get the acc to get the message, before a new program starts, is to make AES calls _after_ the 'appl_exit'... It seems that I am not the only one making bummers.

Sorry, but I was carried away by the perspectives of having a 'etv_term' program doing all the cleaning up :
```
> - handy to close windows and restore the desktree -
> ... This has the added bonus that windows are closed and
>the desktree gets restored - even when the program terminates
>abnormal ...
```

In fact I have tried to have the exit code in the 'etv_term' chain, using some code looking like this :

```
extern void Set_etv_term(void *a);
extern void (*Old_etv_term)(void);

void Close( void )
{int wind;
wind = Text.WindId;
graf_mouse(M_OFF,0);
wind_close(wind);
wind_delete(wind);
menu_bar(M_tree, ME_HIDE);
graf_mouse(M_ON, 0);
rsrc_free();
v_clsvwk(handle);
appl_exit();
(*Old_etv_term)();
}

main()
{
Set_etv_term(Close);
Get_sysbase();
...
}
```

And some assembly to do the dirty work, please note that I use Turbo C, which uses the registers to pass parameters, when nothing else has been said (An to pointers, Dn to ints, longs) :

```
include "tos.s"
export Get_sysbase, Sysbase, Set_etv_term, Old_etv_term
TEXT
****** Set Etv_term pointer ******
Set_etv_term:
MOVE.L A0, temp
PEA get_etv_term
XBIOS supexec, 6; Call Xbios funktion and dealloc 6 bytes
RTS
get_etv_term:
MOVE.L etv_term, Old_etv_term
MOVE.L temp, etv_term
RTS

****** Get SysBase ******
Get_sysbase:
PEA get_sys
XBIOS supexec, 6
RTS
get_sys:
MOVE.L _sysbase, Sysbase
RTS

BSS
temp: DS.L 1
```

Sysbase: DS.L 1
Old_etv_term: DS.L 1

But the test program bombs out, not these assembly funktions,
they are working. The function 'Close' is called and closes the
window, and then Illustrates the drawback of having code in the
'etv_term' - it bombs (two bombs), and the bomb routine makes an
'Pterm(-1)' in TOS1.4 that is, the 'Pterm' calls the 'etv_term'
vektor, where the 'Close' code are, which bombs and so it goes on.

Any suggestions ?

-micro@imada.dk (Klaus Pedersen).

3636. in search of a FAST GIF viewer

>However whenever I use the Protobt fucntion I get nothing written to my floppy
>
>Will someone please explain how this Bl**dy function works !
>
>Sam

Protobt merely generates usable data in the memory buffer you pass it. You
then have to call Flopwrt yourself to get the boot sector written onto the
disk.

Btw, how is one supposed to generate a correct checksum for the boot sector?
My impression from reading the description of Protobt is that it completely
overwrites the contents of the buffer you pass it, so you have to make any
changes (adding executable code, altering the parameter block, etc.) after
the call, and most probably ending up with an invalid checksum. Am I missing
something obvious here?

3639. Re: Bug in CSD, no help from MWC

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 15:59:32 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Apr18.155932.4173@chinet.chi.il.us>
Source record: 241637

I've been talking to the ST support guy at Mark Williams Co a lot lately (found 2 MAJOR new bugs in the C compiler while working on the umoria port-- if you use bitfields, be careful and check the generated code; the other one is too obscure to worry about). Anyway, as stated, they aren't presently doing upgrades or new products for the ST. They are, however, still providing help and advice. They are still doing the record keeping needed to get back into ST development fast, should the demand appear. If the expected 520ST blitz sells lots of machines (that could go either way), it might make the difference.

3640. 6-chip/2-chip TOS 1.4

Newsgroup: comp.sys.atari.st

From: bills@mcrware.UUCP
Message-ID: <1601@mcrware.UUCP>
Source record: 241640

I recently purchased the six-chip set of TOS 1.4, but need to install this in a two-chip machine. I have access to a ROM-burner, and would rather put this to use than to make the hardware hacks on the Mega. I have the code from the chips in three files, corresponding to the L0/H0, L1/H1, and L2/H2 pairs of chips. How do I concatenate these to create an image for the two-chip set (and what EPROM device is the two-chip set made from)?

E-mail to me, I'll summarize...

Thanks!

Bill Sheppard
{sun,uunet}!mcrware!mwca!bill

3641. Re: UUDecode

Newsgroup: comp.sys.atari.st

Source record: 241632

The best way that I have found to break up large arcs that I uuencode/
decode (since I don't have a hard disk) is to ifng (oops) find someone
with a hard disk. I have uudecoded files that were too big to fit on
a floppy, then downloaded them to an IBM PC (ugh) at work where I de-arc
them, and then tranfer the files to floppy to use on my ST. SInce ARC
is the same on MS-DOS as it is for the ST, it makes it that much easier
to find someone with a hard disk (more people with PC systems). Hope
that helps.

3642. SUMMARY: STE compatibility and Hard Disk recommendations

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 16:51:21 UTC
From: eric@castle.ed.ac.uk
Message-ID: <3371@castle.ed.ac.uk>
Source record: 241633

First of all, thanks to everybody that answered my posting.

This is the promised summary in response to my posting a couple
of weeks ago. Essentially, the answers to my two questions are:

1. the STe's are compatible with everything I would want one for (mostly
editors, compilers, shells, and terminal emulators).

2. all kinds of different answers although Third Coast Technologies got
the most votes (not that the number is statistically valid :-).

I have included all useful (i.e. > 0 information content :-) responses
at the end of this posting.

Again, thanks to everybody that answered!

eric

----------//----------
----------//----------
From: Herbert Sauro <eang62@ed.castle>

I saw your mail on comp.sys.atari.st concerning STE compatibility. Four
things I run regularly are:

Mark Williams C - no problems so far
TeX from Tools of W. Germany - no problems so far
Gulam - if you ask for free mamory it bombs out, otherwise seems ok
Prospero Pascal - no problems so far.

I think you'll find that the majority of serious software runs without
problems. Its probably mainly games which are having problems with
compatibility. Basically don't believe what you read in the mags,
expecially ST Format and those weeklies.

Herbert Sauro
Genetics, KB, Edinburgh

PS I have a 2MB STE (SM124 of course) + home-made hard disk and I am
quite happy with it (especially the price, 450 pounds for 2MB STE).

----------//----------
From: olorin@ed.cs.tardis

I've just got an STE myself (4 meg 600 quid from best prices).
The following stuff I have checked and it appears OK.

GCC , Minix , Gulam , TeX ... I'll check Uniterm.

Mind you there's a rumour going round of an imminent price increase ...

------------------------------------//------------------------------------
From: "Jwahar R. Bammi" <bammi@edu.cwru.ces.curie>

eric,
i have second hand report from people who use some of the stuff
that i wrote/ported that it all works on the STE (and TT, some of the
stuff was shown at Ceebit), this list includes:
gulam, gcc, TeX (StTeX, undump, BiBTeX), zmdm (terminal emulator with
x/y/z modem).

gulam: dont use the 'mem' builtin command, and you'll be ok.
no one have reported any other incompatibility.

GEnie: J.Bammi

------------------------------------//------------------------------------
From: Graham Thomas <grahamt@susx.syma>

Eric,

I'd appreciate it if you'd pass on whatever answers you get. I'm
thinking of getting an expanded STE myself.

The hard disk question is tricky, isn't it? We've had reasonably good
reliability from our Atari SH205s and Megafile 20s, but they lose out a
bit on price/performance. Supra disks have been a bit flaky (I know of
three which have been ordered. Each has had to be sent back to be
replaced. Frontier have been very good with support, and two of the
three replacements have been reliable.) The Power Computing disks look
tempting in terms of price, but I don't trust the company (not from
personal experience - just things I've read about them from other
users). The Vortex drives are heavily advertised in German mags, and
are probably wery well made, but they're a bit more expensive than
others. Third Coast drives might be the best compromise. I've not used
any, and the company, I've heard, is a bit small and chaotic, but I've
not heard of serious problems or dishonesty.

Cheers,

Graham

------------------------------------//------------------------------------
From: CSTMCS@stafpol.cr83
Sender: "JANET CSTMCS@UK.AC.STAFPOL.CR83" <CSTMCS@stafpol.cr83>

I think the best on the market at the moment is the THird Coast Technologies
65Mb or 85Mb drives. These are reasonably large, and relatively cheap.
(65MB = #599, 85MB = #699) Both will take a second internal hard drive, which
if it's SCSI embedded, can simply be plugged in. TCT offer a 4.5% educational
discount, which you'd probably be able to use if you work at Edinburgh Uni.

As an alternative, since the TCT drives are so easily upgradable, you might like to buy a smaller unit, and add an additional drive. In Micro Computer Mart there are regular advertisements for 40Mb Scsi drives for about #100. In the last issue, there was even a 85Mb Nec drive for #150.

Finally, the TCT drives are some of the fastest available (typically 25ms) and have favourable reviews in various magazines (ST World, Jun 89 (?), ST User, Aug 89/May 89 etc. THe 85MB has a removable drive mechanism for security.

I'll be buying a 65Mb drive next month, so if you get good reviews of other drives, could you forward the details to me, (though I have checked the competition very thouroughly:-)

Good luck,

Mark
(Computing Services, Staffordshire Polytechnic)

------------------------------------//------------------------------------
From: SCOFFIN@ox.vax

>From :
Rob Scoffin
Inorganic Chemistry Laboratory
Oxford
SCOFFIN@uk.ac.oxford.vax

I have just read your plea in info-atari16 for largish Atari HD's. We have two 65Mb drives bought from Third Coast Technologies in Bradford (look in any copy of ST User for details). The drives come in pretty "basic" cases but they seem well made and have enough space (and power supply potential) to add a second drive or a tape streamer (TCT sell their disks redy fitted with 40Mb streamers if you like). The disk driver software and utilities provided seem much better than the stuff that comes with the "Real" atari drives.... The last time I looked at their ad's I think they were offering 105Mb (all the way from 20Mb upwards) at quite a reasonable price... So far we have had no problems at all with either drive....

Hope this helps....

Robbie Scoff

p.s. Atari's financial health ???? Who does care ????

------------------------------------//------------------------------------
From: Ralph Haglund <qralph@se.lth.dna>

Hi,
I am not in England, but I can always say what I would do...
Obviously buy a STE520 and put in SIMMs myself.
Get a 105Mbyte hard disk from Germany for DM1999. Fast, SCSI. I got an 85Mb in August from that same company that now sells that beast. My disk slowly died with more and more errors (after all it is a Seagate, the 105Mb one isn't...), returned the whole a few weeks ago to Germany, and a few days back I got paper from the customs here that it was back, they just wanted a few

additional papers to show it was a return so I wouldn't have to pay customs twice.
Dunno what you plan to do - I occassionally do service on Ataris so I am not afraid of opening them up...

3643. Second request for CX80 Trackball mod information.

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 16:51:24 UTC
From: longj@LONEX.RADC.AF.MIL
Message-ID: <9004181651.AA01076@lonex.radc.af.mil>
Source record: 241646

This is a second plea for info on modifying an ATARI CX80 (thats eight-zero) trakball to work as a mouse on the ST. I have an article for the CX22, but they seem to be totally different beasts!

Surely someone must have done this mod before !!?? (and I'm sorry for calling you all Sirley :-))

> Uhm. Maybe your C library does the Fsfirst ?

Uhm. The capitalized "function calls" are actually direct OS calls,
with no library intervention. What you see is what GEMDOS saw, with no
interference from anything.

What do you take me for?

> If so, I would like to hear from it. I am trying to translate it myself,
> but have some problems.
I compiled an older version of it with the gcc. Very few changes were
necessary. However, it was a bit slow (using 16 bit integers would help --
perhaps the MS-DOS version of omega would be a better starting point).
It was also quite buggy; again, the fact that it was an older version
may have something to do with this. At any rate, I can strongly recommend
using the gcc for doing any ports of unix software; the library has a lot
of commonly used unix functions, including a non-multitasking fork().

Hi,
How do you clear a MFP Timer interrupt after it's been serviced
without simply clearing the correct bit in the correct MFP register?
(directly doing a bclr #x,FFsomething, I mean)

Surely doing this is liable to break if the address of the MFP registers
is ever changed?

On a different subject the STe Populous is now ready. Phone Electronic
Arts if you want your copy upgraded.

Also, Power Computing's Series 900 Hard drives may be flaky on the STe,
I am in the process of getting my 2MB STe replaced by Best Prices (in
the UK) because files copied on to the drive get trashed. PC say it's a
faulty DMA controller but Best Prices tested my machine on an Atari HD
with no problems. They have nevertheless sent me a new machine and have
been really helpful about the whole thing. I should get my replacement
STe tomorrow so I'll let you know if it really was the machine or the
drive.

Despite putting the price of the STe up by 100 quid Atari UK *still*
aren't supplying the new control panel with the machines. However, if you
get out you're trusty jiffy bag and send back their old language disk
they say they'll replace it.

3650. (1) OCR experiences? (2) EMACS/shell capabilities?

Newsgroup: comp.sys.atari.st
Date: 1990-04-18 23:35:00 UTC
From: BROLIO@cs.umass.EDU
Message-ID: <9004192056.AA03608@crash.cs.umass.edu>
Source record: 241635

Two questions:

1. Has anyone used OCR software (e.g., the Geniscan stuff, or anything for the mac) and what's the report on it? (OCR=optical character recognition).

2. Are there any posted emacs (say gnu) that interact with the gulam shell well? I am interested in the "suspend and go to shell" type functions. I am still using emacs 3.7 because it does that well, even though that release had no rational concept of a word (it thinks the first alpha-numeric character after a space signals the end of the previous word!)

3652. DMA Port SCSI Adapter

Newsgroup: comp.sys.atari.st
Date: 1990-04-19 02:20:50 UTC
From: alan@cpsc.UCalgary.CA
Message-ID: <1990Apr19.022050.13824@calgary.uucp>
Source record: 241636

Does anyone know of a company (preferably in canada) that manufactures a ''box'' that will allow someone to connect a SCSI hard drive to the ST, via the DMA port? The reason I ask, is that I would like to buy a new computer is a couple of years.. as a result I will require a hard drive for it as well, the fact that the drive may be SCSI will facilitate this immensely and keep me from spending $$$ for a useless HD. It would also be nice if this DMA2SCSI box will allow chaining of devices like MORE HD's and even tape backup units. (or is that inherent in the SCSI protocol?)

Mail or Post those reply's .. this is an urgent question. :^)

>Will someone please explain how this Bl**dy function works !
>
>Sam

OK, I'll try. The Protobt function doesn't write to the disk at all. All the function does, is create an image of the bootsector, as specified in the parameter list, in memory. The adress where it is to be placed is given by the "buffer" parameter.

After the image has been created by calling Protobt, you can alter it (e.g put in your own bootcode or change any other parameter) and send it to disk using "Rwabs".

It is very kind of You to translate the documents. But we have made
an english version of the programs to which the docs should refer.
Also, we found someone in the Netherlands who is now translating the
docs. If you don't mind, please send me the docs, so I can change the
names of the dialogs and menu entries.

When we got the english docs, we will beam an english version of
Gemini 1.1 to the world immediately.

>>>magnitude, thus there is not enough room for it on a 3.5" disk.
>
>Why not just decode it on the host machine? If it doesn't have
>uudecode, then just port uud, for which portable source coude is readily
>available (from me, for example).

I am afraid everyone who has replied to the above article has failed to
see the point I was making, whether or not this was because I worded it
badly I do not know.

The problem does not lie in the actual FTP'ing of the file to my atari
the uuencoded file does fit on a single 3.5" disk, but if I was to
decode the file on that disk it would create another 700Kbyte file,thus I
would have to get 1.4 MBytes of data on the disk, slight problem there.

The suggestion of uudecoding on the host then doing a binary transfer, is
an improvement, however the file is 500Kbytes when decoded and to then
dearchive that file would require a further say 400-500Kbyes available
on the disk, same problem as before but slightly less.

I have however managed to solve the problem by creating a very large RAM
disk on a 1040ST then decodibng into the RAMdisk, ie. using it as a
temporary store, 'til I can clear space on the disk.

Thanks for all the help all the same

Adrian

From: balkwill@ncs.dnd.ca
Message-ID: <872@ncs.dnd.ca>
Source record: 241512

Hello Stefan. I would be glad to send the docs but I don't know how to reach you. I'm talking to something called DreNet which interfaces with Internet which interfaces with Usenet which ... In short, my mailer doesn't know anything about dmswwu1a.bitnet.

In any event the docs should be appearing at panarthea soon (they did arrive didn't they Steve?). Throughout I tried to reference both the German words that appear on the screen and English equivalents from the 1.0 release. I rather like the screen the way it is now - adds a certain charm.

At any rate, if you have problems with panarthea the way I have problems with bitnet, let me know and I will drop everything to get the docs to you.

Bob

>Btw, how is one supposed to generate a correct checksum for the boot sector?
>My impression from reading the description of Protobt is that it completely
>overwrites the contents of the buffer you pass it, so you have to make any
>changes (adding executable code, altering the parameter block, etc.) after
>the call, and most probably ending up with an invalid checksum. Am I missing
>something obvious here?

Yes. Protobt sets the appropriate parameters for cluster size, counts,
etc. based upon the third parameter:
-1 - No change
0 - 40 tracks, single sided (Right! Tons of these babies out there.)
1 - 40 tracks, double sided (These Too!)
2 - 80 tracks, single sided (Ahh, reality strikes!)
3 - 80 tracks, double sided

It checks the fourth parameter for a flag to determine if it is to be
executable:
-1 - No change
0 - Not executable (MWC manual is wrong here)
1 - Executable (MWC manual is wrong here)

The executable flag determines the checksum value. There is only one
significant checksum (executable), or any other value. The appropriate
checksum value will be placed in the last two bytes of the buffer.

The remainder of the buffer is left untouched. Whatever was in it
at the call to Protobt will be there afterwards.

3661. Booting PC-DITTO I and II from HD

Newsgroup: comp.sys.atari.st
Date: 1990-04-19 12:44:36 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1636@lzsc.ATT.COM>
Source record: 241650

Here are the results of exploring boot problems with pc-ditto (I and II).
These are empirical:

1. PC-Ditto (PCD) Can only access SCSI 0, LUN 0.
These are embedded in constants.
2. PCD seems only interested in booting MS-DOS from partitions C: and D:
3. For a partition to boot MS-DOS its last 2 bytes MUST be 55,AA. They
do not use a 'checksum'.

Here are some facts and remedies:
I have two systems, with the c: partition loaded from the same Cartridge
Tape. That is Identical! One system would boot from the HD, one would
not.
Drive C: does not have a MS-DOS boot in sector 0. It did once. I think
that playing with the Supra boot installation messed it up.
The system that boots, has a MS-DOS boot in d:. The other doesn't.

If I change the 55,AA to 00,AA then neither system will boot from the HD.
After restoring the 55,AA and copying sector 0 of D: from one system to
the other, then both boot from the HD.

When PCD is started it reads only the following sectors:
1. Absolute sector 0, for the partition table.
2. c: relative sector 0 (boot) is read twice.
3. D: relative sector 0 (boot) is read once.

When the floppy is removed, and DOS told to start:
1. D: relative sector 0 (boot) is read once.
This is probably due to c: not being a MS-DOS boot.
2. booting takes place from partition C:

Current ICD problems.

Using your favorite sector editor (memfile, Supredit, ICD ???) or a simple
program, look at the c: and d: boot sectors (0). Look at the bytes from
0x1A0 to 0x1FE. You should be able to find the strings:
"Disk Boot failure\r\n\0"
"IBMBIO COMIBMDOS COM"
and the last 2 bytes are 0x55,AA.

If neither are like this, it won't boot from the HD.

To repair I would suggest the following:
1. Don't worry about c:. Your ST autoboot installer will probably change it.
2. Install the MS-DOS boot in d:
The easiest is to use "format d:/s" while running PCD.
If you dont want to destroy what you have on d:, then try this:

3. "format a:/s" a floppy instead. What you want are bytes 0x20 thru 0x1ff.
Using the form of the simple program attached, read from A: and D:
Combine the first 0x20 bytes read from D: with the rest from A:.
Rewrite the new 512 byte block on D:.

```
============program to read boot sectors===========
#include <stdio.h>
#include <osbind.h>
char buffer[512];
main()
{
int i;
long *lp;

/* change the last number (3) to the partition: 0=A: 2=c: 3=d: */
/* change the first number (0) to 1 to write! */
Rwabs(0,buffer,1,0,3); /* read from D: */

lp = (long*)buffer;
for(i=0;i<128;i++)
printf(" %lx",*lp++);
printf("\n");
}
```

From: pbh@pandora.cs.wayne.edu
Message-ID: <1145@wsu-cs>
Source record: 241513

I have talked to MWC a few times, and the reason they gave me for not
continuing development for the ST compiler was that their compiler
programmer for the ST left, and they were having a hard time finding
a new one (I assumed the difficulty was finding one who could do
an ANSI-C upgrade, but accept little money up front and mostly royaltys,
if I were the programmer and I was familiar with ST marketing, *I* would
be very unmotivated about potential royalties from the sale of an ST
product..)

No, that's not a flame, I own and like both my ST's. It's just (the current)
reality re: our Ataris and Tramiel-corp.

Sorry, I'm a machine language programmer, no experience with the C nomen-
clature :-)
Uhm^2. My RAM TOS 1.0 (GEMDOS V0.21) also clobbers files with Dcreate () !
Also the ROM TOS 1.0 in all machines at FU Berlin's physics department.
Am I hallucinating ?! PLEASE could anybody (outside Germany) try it on his ST ?
If this problem is unique to our machines, this would be really strange ...

if i'm not mistaken, after calling Protobt and making the necessary
changes within the buffer to get your fancy boot sector, you still have to
do a Flopwr() call to write out the boot sector to the floppy. all Protobt
does is create a standard boot sector within the buffer you pass down as
a parameter. it shouldn't read or write to the disk at all, if i have my
info right.

|>[A few arguments as to why Apple wouldn't be losing much in the shuffle
|>deleted...]

Maybe Apple/Atari/Commodore wouldn't have much to lose, but the people who buy these machines lose out on a lot. I have had my Amiga for a number of years now, and I just wouldn't be happy with anything else. Each of the different machines has their relative strong points - the Mac for DTP, the Amiga for DTV, and the Atari for MIDI. If the Mac OS (or the AmigaDOS or the ST's DOS) became the 'standard,' what about all the features that would be lost from the other lines...?

Netters,

Having seen a very large number of requests for bomb error information
I have written a short program to explain the meaning of most bomb numbers!
It is available from me and if someone would be so kind as to let me know
the address for submissions to the panarthea library then I will send it
there.

requests for help to me at the address in my .sig file, flames to \dev\null !

regards,

Simon

There exists no EPROM with the right pinout for 2-chip Megas. There
may not be any such OTP, either. That was a problem when we were
building developer releases, etc. You just can't do it.

If you have six sockets, you're 90% there. Find the instructions for
cutting & jumping to make your 2-chip Mega a 6-chip Mega.
Alternatively, you can buy the 2-chip TOS 1.4 set. It's available, and
has been for many months.

I think that instead of assuming that one system's OS would completely
REPLACE the others we should attempt to support the advantages that all
computers would be able to offer if the better parts of each OS were added
to the whole.

Each company has spent millions (even more, I'd imagine) on the development
of their system software. Would not the entire computer industry be better
off if those millions were "combined" into a single project?? Alas, if that
were done, then the marvels of capitalism would have been abandoned ;)

We definitely have a long way to go in the
realm of cooperation... (myself included)

I don't think you can do it. The megabit Eproms are 32 pin or maybe 30 but the sockets
aren't. If you manage it, it'll be more of a hack than doing the 6 chip mod.

There was talk long ago (from Atari) of releasing an expansion chassis. I
presume this would use some sort of ribbon connector, and have switches
or something to differentiate between the different cartridges. I have not
heard anything about it for a long time, but perhaps some third-party
vendor has jumped on the idea (this would be a nice thing to add to Omniswitch).

>Ed

I've been reading this discussion with probably a slightly different
view-point from most others involved. I'm a Unix programmer (on PC boxes)
so I am rapidly gaining quite an understanding of Unix, I've programmed
Mac's, and I own (and *very* much enjoy) a machine called the Archimedes
from Acorn in the UK. My favourite is still the Archimedes, but I know
quite a few people who still prefer Macs, Unix, etc. over it.

It's very easy to become complacent when your operating system is very
popular, because you assume that it has to be good, otherwise it wouldn't
be popular. This is totally incorrect. Marketting pressures have far more
impact (particularly international marketting) than technical brilliance.
I know that many of the concepts of RISC OS (the Arch's OS) are being
integrated into the Mac's System 7. I also know that many concepts in RISC
OS come from the older Mac Systems. This cross-fertilisation in good.

What would not be good is to force one of these operating systems on
everybody. Unix is one of the best multi-user operating systems (for a
variety of reasons). The Mac's System X is one of the best office
automation operating systems (remember: this was its original target).
RISC OS is one of the best programmer's and educationalist's operating
systems (due to its inheritance from the Acorn BBC: undoubtedly the *best*
educational system in the world at this moment, counting software and
peripherals).

We don't yet have the skills, software, or hardware to create an operating
system that can fulfil all of these roles well. When we do we can all be
very happy. (Except those of us, like me, who enjoy being contrary. ;-))
I firmly believe that proprietry systems are not only nice to have around,
but vital. Being a programmer, I don't give that much concern to
straight-forward compatibility. Ease of programming and sheer power are
far more important to me. I know there are other mavericks out there, and
I cheer them on: Proprietry Systems Rule!

[My words are not, unlike Holy Scripture, infallible. I suggest no religions
be based on them.]

Amiga, a state of mind.

A FRIEND OF A FRIEND OF A FRIEND OF A FRIEND OF C=, told me...

OK: These are 99% accurate.

A3000 launch: 27 March at World of Amiga in New York City. Canadian launches are May 7 at Ontario Science centre and May 10 in Montreal at Sheraton Laval. I beleive that there will be a Vancouver launch as well... You need TIX for Canadian launches.

SPECS: It will be in next BYTE. 2 versions differing only by clock rate of CPU. 1 is 16 Mhz 030 and other is 25 Mhz 030. FULL 32-BIT MEMORY, ON MOTHERBOARD. AUTOCONFIGS TO 18 (over 15 at least) 32 bit. 2 MEGs of Chip memory. Flicker-fixer-like device eliminates flicker in all modes, and works with PAL. Has new Denise and Agnus. Has x# of ZORRO 3 slots (which are full 32-bit addres-able). KICKSTART 2.0 = 512K. Initial release will NOT include scalable fonts. NEW: A CPU slot (?). Less PC slots. Power on the front, sleaker looking. PRICE: similar to 25/30's.

ULOWEL CARD: Will be released together. 256 + 2 colors out of 16 m.

Amivision: Released at same time.

IE: three products in less than 1 month. Lots to chat about...

Don't expect to see UNIX 5r4 for any system b4 September, ON ANY SYSTEM!

>seems to be the new "smallest" disk).

A while back, a company called Convergent Technologies developed a system called the Unix PC (also called the AT&T 7300). This system was sold by AT&T, and ran SysVr2. Minimal configuraation was (I believe) 256kB RAM, 10MB hard disk (you did have to trim unix to fit in 10Mb -- they recommended at least 20MB).

I ran one of these systems with 512kB RAM and a 40MB hard disk. I also ran news on that system (and accepted a full feed (which I trashed most of as fast as it came in) over it's on board 1200 baud modem). It had it's own windowing system (it was first released about 1984 or so), and was able to successfully compile Larn and Hack as well as the News software.

The current price on these beastes runs from around $600 to about $1800.

Source record: 241530

Having moved on the the Atari from the BBC micro I am interested in interfacing project with the computer. What I find lacking is a simple I/O user port.
The question is this:

Is it possible to set the cartridge port as a user port that allows reading and writing? All the diagrams I have see indicate that this is possible.
If so how do you do it?

The follow on question:

If the above is true, is possible to set it up as two seperate ports, one that is a read only port and a write only port. having done that can they be used together at the so time i.e. read from one while the other is being writen to?

Thanks

Dave

WAIT! This isn't the first time I've seen this reference to "IBM providing
the opportunity for clones," and *I* always thought that IBM never wanted
clones, but pretty much couldn't do anything about it. The Apple II ROMs
had BASIC, etc. so for a clone to be an Apple II clone, it had to copy a lot
of ROM code ... which Franklin didn't do (the first time, they just copied
it. Laser makes Apple II compatibles now, which nobody seems to do any legal
thing against...). The IBM BIOS was duplicated by Phoenix (or whatever),
and since the DOS wasn't made by IBM, Microsoft could sell the DOS to be used
on "clones."

I don't think IBM had any say in this. When the first clones appeared, they
weren't 100% IBM compatible, which doesn't make sense if IBM sanctioned them.
In fact, PS/2 was supposed to be the "clone killer:" introduce new hardware
specs, that this time are a little more complicated (so can't be duped via
clones), lotsa hype (Yeah yeah, we'll call it a ... pel :-), etc. Which was
the big surprise when Micro-channel didn't win the entire DOS-world's hearts.

No, that's because the Mac OS's best features (IMHO) come out when you become
a *power* user, even in the smallest degree. A casual computer user ain't

gonna care if s/he can cut/paste between different applications, etc. because they won't need it. The bottom line for the average consumer will always be price; the jargon scares a lot of people as it is, and the *real* way to win a Mac (or Amiga or ST) over an MS-DOS machine (so far) has been to get into the jargon.

Do you really think that IBM "provided the opportunity for clones"? Their
main reasons for being successful are that they:

1) Provided card slots in the PC so 3rd party manufacturers could release
cards to compensate for an inferior machine.
2) They have an infinite supply of $$$ and a large following of people
that shout "Now we have a standard!" every time they release something,
even if it uses technology 10-15 years old.

>
>If Apple were to license their OS to Commodore, Atari, or whoever, I
>don't think their sales would really lessen, but that overall demand
>for the Mac-OS would increase across the board, including demand for
>the Macintosh.

But I bet they would charge so much for the licensing that Amiga and ST
prices would skyrocket to the level of Macintosh pricing. Overall demand
for the OS would increase because there wouldn't be any more competition!

>When other MS-Dos machines emerged, sales of IBMs
>didn't drop through the floor, conversely, they have remained strong.

Didn't they stop making PCs after the market was flooded with clones?

>I believe Apple has the reputation to insure that their sales would
>continue to be strong. Furthermore, a little more competition in the
>Mac-OS industry certainly couldn't hurt.

True, more competition wouldn't hurt, but I don't consider licensing out
the Mac OS as competition, the only difference between the machines would
be the box they come in.

From: stewart@xyplex.com
Message-ID: <9004201800.AA18499@xap>
Source record: 241520

I'm typing this via Flash to my Unix system, with QuickST from the May STart disk running. It leaves cursor blobs all over the place and often doesn't put the cursor where it belongs. Yucky. I'd feel bad about distributing software that doesn't work any better than that. On the other hand, there is an interesting mixed motivation. If it works too well will I want to buy the upgrade. But if it doesn't work very well, I have the same question.

Now I'm curious to see the response of the co-author...

I tried the posted program on a 1040st with TOS 1.0 in ROM and it did
clobber files with the same name as the directory I was trying to
create while returning successfully. There is a problem when using
TOS 1.0 (ROM) and MWC 3.x.

Come on people!!!!

Aren't there any STe specific programs (demos?) around YET?????

I have heard mentioned a STe "boink" demo, and the MONSTER.ARC
programs. The MONSTER program is like BIGSCRN but uses the
STe's new features...

I would love to get these and others...
I can't believe that there aren't at least some digital sound
background players yet... cause a friend of mine has actually
been able to make the digital stereo sound chip play with minimal
success... using GFA basic and the minimal info from this newsgroup
about the DMA sound chip...
and he isn't even close to a computer programmer!!!

I am very anxious to see/hear what I paid the extra money for!!

I must dispute this claim:
It is quite possible to receive at 19200 baud from an accessory and confine its output to a window (I have done it) true you may need to do low level textblits yourself perhaps and while you are rxing at full scate the application may not get much time but is is possible providing the rx buffer is big enough to bridge the time that you are away in some other application at 2400 baud my program (which is a background eprom downloader) never has to wait more than 3 char spans with its companion program (APP) which makes regular aes calls. (doing your own blits is entirely legal providing you listen to the AES's messages about where to put things)

The trick is to empty the rx buffer every time you get the CPU (Hog until auxstat returns false)

Actually, this is a good question; I should have explained that the fork()
is useful because it lets you emulate the most common Unix usage of fork
(fork(), followed in the child by some file descriptor manipulation and
exec(), and in the parent by wait()). Yes, you could just recode everything
to use Fforce/Fdup and Pexec, but having fork() in the library saves the
effort.

>the opportunity for clones, vastly incresing their "standard." One just
>has to think back to the days of Franklin Computer to see Apple's
>course of action which contunues today.

I don't agree.

1) IBM had lots of inroads in the corporate world that allowed them to roll over the AppleII before lots of clones came into the picture. IBM had a lock on the typewriter and mainframes before the PC. It was only logical that when IBM brought out a PC that the business world would flock to it because they dealt with IBM on everything else while Apple was seen as uncertain counter culture company. IBM was not flashy but everyone knew they would still be there 5 years down the road. Who knew if Apple would make it! Therefore you don't need clones to account for IBM becoming the standard (they were the standard for everything else)

2) IBM doesn't make the PC line anymore. wonder why? They couldn't compete with their own clones. Notice how IBM has made certain that the new PS/2 are incompatable with the old PC's. (Gee the Apple II is still around) Now IBM is fighting a war with its former cloners who want to stick to the old PC standard.

Which leads to the third point:

3) Stagnation!! Look at the trouble that IBM is having pushing the inovations of their new PS/2 line because people want to stick to their old standards and the clone makers are more than happy to oblige them. Not to mention that their was not a lot of innovation to the PC line while IBM made it. When some something becomes standard the forces that work to keep it stable, compatible and unchanging overwhelm the forces of innovation. I mean look its been six years since the Mac came out and IBM still hasn't been unable successfully market a Graphics, mouse based interface because it is so standardized that it can't evolve (except slowly and painfully).

I know everyone wants a cheap Mac clone. It would be great for Mac users in the short run but I don't know if it may not be destructive in the long run.

> Apple were to license their OS to Commodore, Atari, or whoever, I
>don't think their sales would really lessen, but that overall demand
>for the Mac-OS would increase across the board, including demand for

>didn't drop through the floor, conversely, they have remained strong.
>I believe Apple has the reputation to insure that their sales would
>continue to be strong. Furthermore, a little more competition in the
>Mac-OS industry certainly couldn't hurt.

I wouldn't be so optomistic about Apple's reputation. From what I hear on this net most people are loyal to their Macs despite Apple not because of Apple's good reputation. They don't like Apple's pricing policy. They don't like Apple's service, etc., etc. (IBM probably had lots of staisfied customers that bought typewriters, mainframes,etc.)

Also when the clones first came out most weren't fully compatable. It took them a while to achieve full compatability and credibility. unlike today, ads a couple of years ago really made a point of how compatable they were because it wasn't assumed. You don't see that today because PC compatability has been perfected and asssumed. I don't think it would take the clone makers nearly as long to achieve compatability and credibilty with the Mac because they have learned from cloning the PC (and many have been working on the mac for years waiting for an opprotunity.)

I think I have shown above that it could possiblly hurt the Mac in the long run.

Q: Let's face it why does a company spend money to improve their OS making it evolve and keep it innovative?

A: To sell THEIR machines. Not somebody elses. (IBM didn't)

Kiss inovated system software like system 7.0 goodbye in the future if their are large sales of clones. Apple won't bother. They will spend their money to build something new like IBM did with the PS/2 and leave the Mac behind. If we're lucky maybe we will get a trade in allowance for our Mac on the Knowledge Navigator.

Ed

3693. Need an ST

Newsgroup: comp.sys.atari.st

3694. SPECTRE GCR and hard drive backups

Newsgroup: comp.sys.atari.st
Date: 1990-04-21 17:31:40 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900421.11313905.038380@SFA.CP6>
Source record: 241536

For a good while, I've been asking about suitable backup software
for Spectre GCR. Most of the Mac backup software just won't work on the
Spectre since they are referrencing hardware that the ST just doesn't have.
However, I have been told of two packages, DiskFit and Redux by MicroSeeds
that work with Spectre. Redux is the package that I elected to go with
and can be had for $49.00 from MacConnection.
Redux is friendly, comfortable, and fun to use. Seriously! In many
ways it reminds me of Vault and Turtle for the ST but has better error
checks and a very pleasing line graphics for indicating backup/restore
progress. In addition, it has a scrolling window showing individual
files. The window contents can be saved.
The progress is incredibly fast. Although files are not saved
in a manner allowing the user to run them from the backup disk, they
are saved allowing individual retrieval. The user merely clicks on
the file and restores it. Slick.
What about subsequent backups? The program is very intelligent.
I backed up a partition with Redux two weeks ago. Since then, I have
defragged the Mac partitions and optimized them. I have deleted a
few files and updated others..typical maintenance stuff. Today, I
backed up the partitions again. With no fuss or muss, I was asked
to insert only three disks, DISK1, DISK8, DISK13. Only the disks holding
the appropriate files were requested for update. The entire process
took only two minutes.
Something like this makes we wonder for the need of tape drives
and so forth.
So, for you Spectre GCR owners, I recommend Redux for hard drive
backup. Solid, easy to use, and the graphic interface is pleasing
to the eye.
Ah, one important feature that I forgot to mention. Since I'm
using Mac diskettes, I had one disk during the first backup to choke
on me. It was just unuseable. Redux alerted me to the error with
a simple, "DISK I/O ERROR-UNABLE TO WRITE - attempt one - attempt two,
Do you wish to insert another disk?" Another disk gave me a similar
error, but was able to continue on. After the second write attempt,
I was told "Successful recovery!! Files verified!!"
I literally felt as if someone was in the room taking me by the
hand.
Again, recommendations go to Redux for hard drive backups for
the Spectre GCR on the Atari ST. If only it was written for the ST
also! sigh

Hi.. I need some objective, 'non-biased' advice if any one can help... I recently sold my Amiga 1000 in hopes of getting a 2000, but I am giving the Atari Mega a look over... Basically I'm too used to the sharp 1024x768 graphics that my AT clone produces and want that same sharpness in a game/graphics design machine. I would be willing to sacrifice the Amiga's multitasking if the Mega did everything else just as good but with sharper & higher resolution....How are the games on the ST are they as fast???? What resolution do the majority of them display?? 600x400??? Are the floppy drives faster?? (Amiga Drives are very slow) What does a Mega cost Mail order??? Can I use my Nec Multisync 3d with a Mega or will I have to buy the atari color monitor... Very importantly can I put all the comercial games on Hard disk??? What does a base Mega include??? As you can see I know absolutely nothing about Atari ST so the more Info you can send me the better...

Thanks so much for your time...
Please Email IO91461@maine

> that doesn't work any better than that.

Imagine that you're in third grade and you have to walk to school.
You have three options: A long, winding route; a shorter route that
requires a couple of steep hills, and a shortcut through a few back yards.

The trouble with cutting through back yards is that somebody's dog is
liable to bite you.

One of the back yards QuickST cuts through fouls up VT52 cursor
positioning. I don't think the shortcut is worth getting bitten. It screws
up the programs that I use most. That doesn't mean it's bad software, but
it does make it useless here at the lake, and probably for a lot of other
people, too.

This is not a new problem, incidentally. I reported it a year or so ago.
The response I received indicated that it's a known "feature" -- a
tradeoff made when cutting corners.

If Apple was to open up the clone market for the mac, they would have to start selling their System Software, instead of just distributing it. Everyone was thrilled when Apple opened up their system to allow anonymous ftp'ing of system software, but if Apple allowed Mac clones, they would have to make up their money by selling the system software. I couldn't believe it when a friend told me he had to buy the operating software for his PC compatible, but then I realized that it only made sense. Afterall, he was buying Microsoft's software, but someone else's computer. I like the idea of free operating systems, I don't want to see any Mac clones.

Hello,
A little while ago, I noticed a message saying something to the effect
that the BTST bug in the Sozobon JAS assembler is easily fixable and due to a
typo in the source. Could someone please post the necessary corrections or
tell me where I can find them? I apologize if there was a reply to this that
I missed.
Also in the same vein, is there a comprehensive list of Sozobon/Dlibs
bugs anywhere via e-mail request or anonymous ftp? Thanks in advance.

Michael Kieras

3702. HELP: Hard Drive Problem

Newsgroup: comp.sys.atari.st
Date: 1990-04-22 06:50:06 UTC
From: ehood@ics.uci.edu
Message-ID: <2631541E.9748@paris.ics.uci.edu>
Source record: 241549

One of the partitions on my hard drive went screwy on me. Somehow the system sectors (if that's what they are called) got totally canned and the partition is not responding. I do not know if the data on the drive was damaged or not. I try to look at the other partition sectors to see if I couldfind a way to manually fix the hard drive. However there are descrepencies on each partition (probably due to the different sizes of each) that I do not have the time to decipher it all.

If I sound confused. I AM!

Can anybody help me? Is there a program which could fix the problem? Is it possible to manually do it if one knows the right information?

I have a MegaFile 30 broken into 4 partitions:

C: 4.4 MB
D: 14.4 MB
E: 6.4 MB (This is the partition giving me a headache)
F: 6 MB

Any help will greatly be appreciated.

I've a *BIG* question that I hope someone can answer.

This newsgroup is named comp.sys.amiga, right?
Then why in the HELL am I wading through all these messages
about IBM's, Macintoshes, Apple IIGS's, NeXT's, and Atari's?

#include <reminder.h>

In article <9004180711.AA23450@ucbvax.Berkeley.EDU> S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK ("Simon Chappell") writes:
>Does anyone anywhere (but preferably the UK) know anything about setting up
>your own UUCP site on either an ST or (horrors!) another type of machine!?

I ran a BBS on the Atari ST for 6 months which gave access to both mail and news. The BBS ran under Citadel, and the uucp transfers were handled by "UUMAIL". News unbatching, handling and expiring were all done by homebrew software as was the newsreader (which ran like a very distant relative to "rn"). The only major problem I had seemed to be a problem with TOS - if you accessed the same folder a few times (using Setpath) you get some very strange results, (Set path would return "Path Not Found")

>
>When I finish college I would like to have a crack at getting set up, as
>I shall be in a highly paid job and looking for ways to spend my money (wife
>permitting! :-)

If you would like any of the sources for news handling I can let you have them although they are probably not bug free!

Look at STDWIN. I obtained it from osu-cis. The following is
the beginning of the "ABOUT" file.

[Last modified on Sat Jul 30 18:04:08 PDT 1988 by gvr]

1. Target systems

STDWIN is aimed at C programs. It consists of a few header files (of
which only one is visible to the user) and a library. In most cases
some system-provided libraries must also be used in the linking phase.

Currently, full STDWIN is available for the following environments:

(Note that in all cases the code is in beta test state; there may be
bugs, functionality may change slightly in the future and new
functionality may be added, but the basic framework isn't going to
change much.)

* X version 11 release 2
* Apple Macintosh using either LightspeedC (2.15) or MPW C (2.02)
* Atari ST using Mark Williams C (2.1)
* Whitechapel MG-1 running an old version of 4.2 BSD

You may volunteer to create a version for your favourite system, or to
port it to your favourite C compiler for one of the mentioned micros.

A subset emulating most of STDWIN's functionality on an alphanumeric
display (this excludes line drawing but includes windows, menus, text
editing etc.) is available for:

* Any decent Unix that has termcap (tested with 4.{2,3} BSD)
* MS-DOS using the Microsoft C compiler (4.0)

2. Getting the full scoop

I have written a paper about STDWIN which has been published as a
CWI report (Guido van Rossum: STDWIN -- A Standard Window System
Interface. Centre for Mathematics and Computer Science, report
CS-R8817. Amsterdam, 1988). You might get a copy mailed to you by
politely asking our secretary, Marja Hegt <marja@cwi.nl>.

You can also get a source version for any or all of the above-mentioned systems. This is essentially a directory dump of my working version, until I have the time or get some help to prepare a real distribution. It is available through anonymous ftp access to gatekeeper.dec.com, whose IP address is [128.45.9.52]. The directory is pub/stdwin; get the file README for further instructions. A version of the document you're currently reading is in the file ABOUT.

Distribution outside the USA is solely by electronic mail. Be prepared to receive up to half a megabyte (in 50K pieces, tarred/ compressed/ uuencoded/ split). If you're interested, write to:
gvr@src.dec.com
(after October 14, 1988, try once again guido@cwi.nl.)

3. Basic functionality

STDWIN allows multiple "full-function" windows, roughly in Macintosh style (title bar, grow box, close box, scroll bars). The appearance of windows is determined by the default of the underlying window manager, and so are other limitations (e.g., overlapping, maximum size, etc.). Windows are dynamically created and destroyed by the application, never directly by the user or the window manager.

STDWIN uses a coordinate system derived from the display's coordinate system: (0, 0) is top left, with X pointing right and Y pointing down (these are actually called h and v). Pixel size is that of the display. There are enquiry functions to ask for the display size in pixels and in millimeters.

The application is responsible for redrawing the window contents when it is exposed. This is done by associating a "draw procedure" with each window, which knows how to draw the entire window's contents. It gets passed a pointer to the window and the coordinates of the rectangle that needs to be redrawn, so it can (although it needn't) restrict itself to that area. STDWIN guarantees that a window's redraw procedure is only called while the application is waiting for an input event (most implementations simply turn exposure events into calls to the draw procedure).

If the application wants to change part of the graphics it is displaying, this is usually done in a two-phase process: first, STDWIN is told that a particular area of the screen must be changed; later, when the application starts waiting for input events again, the draw procedure is called to update the indicated area (and any other area that was exposed or damaged in some way).

The application defines the width and height of the area it wants to draw; this needn't bear any relation to the window or screen size. This area is called the "document" although you may also think of it as a virtual window. The actual window generally displays a sub-area of the document; the window's scroll bars indicate the position of the window with respect to the document. The application always uses the coordinates of its document; STDWIN performs the translation to window

or screen coordinates are required by the window manager, and ensures clipping of all output to the window.

STDWIN is event-based. An application is expected to have a main loop containing a "get event" call followed by a switch on the event type. There is no event mask; an application can simply ignore events it isn't interested in. The most important event types are:

ACTIVATE: A window becomes active (keyboard attached and/or topmost)

CHAR: ASCII character key pressed (except BS, TAB, CR)

COMMAND: special key or function (CLOSE, TAB, RETURN, BS, CANCEL, arrow keys etc.)

MOUSE: MOUSE DOWN, MOUSE MOVE (only while down), MOUSE UP; fields in the event record indicate the h, v position, the number of the button, and the "click number" if the event is potentially part of a multiple-click sequence

MENU: menu id and item number of a menu selection

SIZE: user has resized the window

TIMER: the window's timer went off; each window has one programmable timer which can be set to go off at N/10 seconds in the future. When the timer goes off a TIMER event is returned.

Currently, STDWIN draws text in a single font. The actual font used depends on the underlying window manager (and can sometimes be influenced by the application programmer and/or the end user in a system-dependent manner). The font may be proportionally spaced, and there are enquiry functions to find out the dimensions of characters and strings.

There are functions to draw text and simple lines, rectangles and circles, and ways to erase, shade or invert rectangular areas. There is no way (yet) to do general bitblt operations, or to influence the pen shape.

3706. CALL FOR DISCUSSION: comp.sys.atari.st.tech

Newsgroup: comp.sys.atari.st
Date: 1990-04-22 22:51:46 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr13.225146.7988@wam.umd.edu>
Source record: 241550
Cross-posted to: news.announce.newgroups,comp.sys.atari.st

```
This is the first call for discussion regarding the creation of a new
newsgroup comp.sys.atari.st.tech. The discussion period will end
on Monday, April 30, 1990. (Total discussion time will be 18 days.)

Initial proposals (to be discussed during the discussion period):

Name
----

comp.sys.atari.st.tech

Charter
------

comp.sys.atari.st.tech will be devoted to technical discussion
regarding Atari ST software and hardware. Examples of topics to
be discussed in this newsgroup include:

"What are the pinouts for the ___ port on the ST?"

"Has anyone managed to hook up a ___ successfully?"
(Assuming this is a nontrivial task)

"Which system vector controls ____?"

"What is the official, Atari-sanctioned method of doing ___?"

"What are the specs for ___ file format?"

"How does ___ manage to get 20 million colors on the screen?"

"What is the best way to do fine scrolling?"

Examples of topics NOT to be discussed in this newsgroup include:

"How do you get past the dragon in ___ game?"

"For sale: ___"

"New product announcement: ___"

"My ST is better than your ___ because"

"My ___ is better than your ST because..."

"Atari's financial situation is ___"

Moderated?
----------
```

My initial proposal is that this group should be unmoderated.

Voting for/against:

The official vote will not be taken until after the discussion period has ended. No votes will count officially until the CALL FOR VOTES is made.

Thanks.

Dave Baggett
dmb@cscwam.umd.edu

3707. NTSC composite video / audio

Newsgroup: comp.sys.atari.st
Date: 1990-04-22 23:13:05 UTC
From: billm@gaudi.CSUFresno.EDU
Message-ID: <1990Apr22.231305.491@gaudi.CSUFresno.EDU>
Source record: 241453

OK, I've asked before, but since that was my first ever post, I'll ask again, just incase I blew it somewhere along the line and it didn't get out (I never read it at my site). Does any one know at what location I can get an NTSC composite video signal from my ST. I have one ov the older models with an RF modulator, so there has to be a straight composite video line in there somewhere. I'm asking because opening up the RF modulator involves de-soldering it's radio shield, and desoldering 8 or 9 pins that connect the RF board to the mother board. I'm hoping someone out there who has done this can tell me about it before I desolder it all just to take a look. Have any of you netters used CYBER-VCR? If so, where does it get the signal to send to the VCR?

BTW, I just added audio ports to my ST (piping Falcon through my stereo is a must to get the *feeling* of the afterburner). If anyone is interested in how to do this, drop me some mail, it's a piece-o-cake that can be done for less than $5, and in only about 10 minutes time.

3708. Current Notes Archive at terminator.cc.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1990-04-22 23:15:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9004242306.AA12231@ucbvax.Berkeley.EDU>
Source record: 241548

This posting is provided as a public service by Current Notes Magazine in an effort to provide Internet and Usenet users with access to useful information about Atari ST computers and software.

The Current Notes Archive at terminator.cc.umich.edu

The Current Notes Archive at Terminator is contained in the subdirectory /atari/magazines/curnotes. To access the archive you must log on to terminator.cc.umich.edu using anonymous FTP (see David Paschel-Zimbel's "Welcome to comp.sys.atari.st" for more information).

As of 5 April 1990 the archive contained the following files of general interest:

cnstores.asc - A list of stores that carry Current Notes Magazine. This is about as good a guide to Atari retailers in North America as currently exists.

regclubs.asc - A list of Atari User groups who have registered with Current Notes to receive subscriptions to the magazine at discounted rates.

cnlib.arc - The complete Current Notes disk library as of 1 April 1990. There are over 300 disks in this library. Their contents represent most of the good freeware and shareware that can be obtained for the Atari ST. These discs are widely used by User groups as their main source of PD software because some care has been taken in assembling the discs and the documentation. Uniterm, TeX, ARC, and many other useful tools are included here.

cnlib*.asc - these files are somewhat less terse descriptions of monthly releases of new disks for the Current Notes library.

cn??_ind.txt - Yearly indexes to Current Notes magazine. This is a convenient place to determine whether a product has been reviewed or discussed.

cnfacts1.arc - a compilation of information about the magazine. Also contains ARCed versions of some of the files listed above. Subscription information, advertising rates, and information for prospective authors are also included here.

stupd*.asc - Copies of the popular ST Update column from various issues of the magazine. The information presented here has been carefully checked and cross-checked. It is about as good a summary of current events in the Atari world as can be obtained.

toc*.asc - Copies of the Table of Contents for recent issues of the magazine. This is a reasonable guide to the subjects that are covered in the 80 or so pages that comprise each issue.

As mentioned above this archive is accessible only via FTP at the moment. This was done because it is the simplest route that was available. People who cannot get to the information in this way are hereby asked to send e-mail to JOHNBARNES@ENH.NIST.GOV if they want to try to work out something else.

The staff of Current Notes magazine does not receive payment for their services. The magazine is not affiliated with Atari Corporation or with any other commercial interest. The information presented therein is the personal responsibility of the authors and is offered in the public interest.

Jeff Weiner at terminator has been doing an outstanding job of managing this archive.

John Barnes

3709. MT C-Shell and Laser C

Newsgroup: comp.sys.atari.st
Date: 1990-04-22 23:25:11 UTC
From: heavy@sparky.eecs.umich.edu
Message-ID: <2046@zipeecs.umich.edu>
Source record: 241452

Is it possible to set up MT C-shell so that Laser C's cc and make commands work properly. I tried to get it to work properly, but it was of no use. I recently bought a 19" Viking 2 monitor and the Laser C shell does not work on it (with no upcoming upgrade) so I want to get Laser C working under MT C-Shell, if it is possible. If anyone knows how, please mail me explicit instructions....

Thanks,
Richard Hall
University of Michigan

Don't be a shithead. You should have noticed from the article headers that the posting you were responding to had multiple newsgroups on it. The newsgroup header from your article also appears in this reply. If you're gonna flame other people for posting in the wrong newsgroups, you should at least Cover Your Ass and make sure you're posting to the correct group(s) as well. I'm reading your posting in comp.sys.atari.st, by the way, and it's certainly a surprise for you to tell me and all the other ST readers "this is comp.sys.amiga." It's even worse that you say it twice, as two copies of your article have been sent out.

Next time, read the article headers before flaming someone for posting in the wrong newsgroup. And confine your followups and cross-postings to the relevant groups. If you're not competent enough to handle that then you shouldn't have posting privileges.
>
>#include <reminder.h>
>{This newsgroup is comp.sys.amiga. If you want to talk about
>some other machine, subscribe to comp.sys.[machine].}
>---
The wonderful feature of "cross-posting" means there aren't firm walls between newsgroups. Saying "this is xxx" is meaningless in this context.

>#include <disclaimer.h>
>My views don't represent those of UF. Mine are rather sane...
>Internet: jma@beach.cis.ufl.edu

Since it appears that your eyes are closed, I wouldn't trust your views to be much of anything.

>
> Bob

i'm beginning to think that this is dump on Branch Always Software
week on Usenet. but nonetheless, you're observations need some comment ...

If you have been following the threads on Quick ST over the last couple of
weeks, you probably have noticed the postings that confirm that version
1.8 of Quick ST did indeed have a cursor repositioning bug, which left the
infamous "cursor blob" all over the screen. This bug has been fixed in
our latest release, version 2.0 (aka Quick ST II).

you say that there may be a motivation of putting out "buggy" versions in
the STart disk. In fact, the version on that disk is the real, official
version of 1.8 which we were selling from November 1989 to March 1990. We
did not make a buggy version just for the STart disk. STart asked us way
back in december if they could place a version of Quick ST on their disk,
so we authorized them to distribute 1.8 since the 2.0 update would have
been available by the time the magazine issue appeared. simple as that. it
was a good idea by STart, since even more people were given a chance to sample
the advantages of a software blitter, and it was good for us since it was
basically free advertizing.

Since most users in
the ST world do not log onto a unix system with flash, most users have not
really noticed the problem, and thus many people who purchased Quick ST in
that time frame and received 1.8, haven't even mailed back their disks for
upgrade to 2.0!!! (this is a reminder for all those who haven't yet: get
those disks and the $3.00 upgrade fee in!!! we're sure you'll like the next
version even better!)

anyways, that is the advantage of being a registered user: you are entitled
to the latest upgrades as soon as they are released. people who stick with
the demos or older versions such as the one distributed on the Start disk
are stuck with those bugs until they either purchase the real thing or
upgrade. its as simple as that. you can't run a business by giving out your
product for free. after all, it ain't capitalism! :-)

we feel that as Atari software developers, we have an excellent product,
at an extremely affordable price. we offer updates quite regularly (about
4 a year), and are constantly working on newer innovations. we have supported
all those who contributed as shareware owners, thus keeping their investment
intact. we actively answer questions as much as possible on Usenet, Compuserve
and GEnie, as well as phone questions whenever possible. if these are
not reasons enough to give us a chance, then we will be the first to tell
you to go out and buy Turbo ST and take your chances with that piece of
software, and leave us alone. like Alan Pratt has indicated many times in
the past, it is easier to answer questions when they are not presented in
such an aloof and confrontational a manner as this one was.

well, i think i've said enough. both Darek and myself have *** FINALLY ***
finished our program at University of Waterloo, and are now Computer
Engineers. so i think that now we might actually have enough spare time to
really begin some new development on further products. and respond to
enquiries as this one.

(aaarrrggghhh. edmonton is losing to the kings so far tonight!
the canadiens are losing to the bruins 2-0 in the series. these are not good
signs!)

>is garbled.

>Dylan

Sorry to hear about your data. But the manual does discuss at length
how to be careful in this matter. And it does explicity discuss this
case. Using this resart option is the same as switching off the computer,
a definite no-no.

This is not a bug in Spectre. It is an unfortunate consequence of the
way the two worlds meet.

For OS-9/68000 which is source code compatible to UNIX(tm) a complete
UUCP/News/Mail implementation exist and works really nice. E.g. I m using
NN to post this message.

UUCP fort OS-9 is part of the TOP Distribution.

3716. Process Descriptors

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 08:38:48 UTC
From: R.D.Chafer@sysc.salford.ac.UK
Message-ID: <23.Apr.90.09

Dear Netters

The Hitchhikers Guide to the BIOS makes reference to struct pd, a process descriptor (found via Getmpb). Does anyone know the flayout of this structure.

Thanks

Robert Chafer

> computers for which there are ANSI VDI implementations, [...]

There is an upcoming international standard,
'Computer Graphics Interface' (CGI, ISO DIS 9636)
which provides all you need to do interactive computer graphics and
enables porting application programs between different machines and
operating systems.

> The ANSI VDI standard does have some shortcomings, however. At least
> as implemented on my machines, (a) it does not allow me to write to
> a buffer (from which I can blit portions of the buffer to the screen),

The CGI standard provides all the functions for bitmap graphics, e.g.
create bitmaps, display one bitmap while drawing on another, operations
between two or three bitmaps.

> and (b) its mouse functions (vrq_locator() and vsm_locator()) do not
> allow me to poll the mouse to see if a button has been pressed:
> [...]

The input model of CGI knows of synchronous and asynchronous modes:
REQUEST, SAMPLE and EVENT mode (e.g.: Event means, actions are queued
and the application program could inspect the queue to detect mouse
button operations and mouse positions).

> This leads me to question whether I should try to re-port the graphics
> routines to another standard. [...]

Yes.

Up to now, I know of CGI implementations for
DOS, using EGA graphics
DOS, using separate card with high resolution
UNIX using X11 graphics
VMS using DECwindows
They all use the C Language binding of CGI, but as this language
binding is not yet fixed in ISO, they use different function names

and parameter types.

As soon as the binding is Standard and the CGI implementors have updated their functions you could port your applications with very little effort to new environments (provided there is a CGI for that environment).

Best regards

3722. Documented Index for terminator...

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 12:59:00 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000059@ux1.cso.uiuc.edu>
Source record: 241471

Two things:

a) I put a file at terminator called xxxxs.lzh which will
go through a file (in my case a PageStream doc) and
replace sequences of X's with an incremental counter.
i.e. xxxx filename.ext -start -count -#ofXs -duplicates
(new files are created if not enough XXXXs are enc-
ountered (unless none are))

b) If you have used a program from terminator, please mail
me the following info: title, author, usage,
limitations, bugs etc... I will compile the list
and put it there as DocumentedIndex.

3724. SCSI Host adapter comparison question

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 15:06:34 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <3111@rodan.acs.syr.edu>
Source record: 241470

I have some ST-SCSI questions for all of you in netland.

1) If you have any of these adapters, please explain how it is performing, how bulky it is, how good and trouble-free the driver is, and where you got it, if for a price lower than the price I have:

Product U.S.$$ Mail order supplier Phone #
------------------------- ------ --------------------- -------------
ASTRA SCSI HOST ADAPTER $99.95 B&C Computer Visions (408)749-1003
BERKELEY SCSI HOST ADAPTER 134.95 (same place) (same number)
SUPRA SCSI HOST ADAPTER 99.95 (same place) (same number)
ICD SCSI HOST ADAPTER 94.00 1st STOP Comp Systems (800)252-2787

Any others not on this list??

2) How difficult is it to format and use attached volumes? Since there are so many different drives that can be attached, how do you tell the driver how many tracks, etc. etc. (or is it all automatically taken care of?) Compatibility with existing software is of course a major concers. I would like to use it with Spectre128 and maybe eventually with SuperCharger, so I will also need the beastie to have DMA out.

I intend to get one of the above to drive a SyQuest 44MB removable media drive. I have a list of some of these SCSI SyQuest thingies and will post along with my summary. There is a newer SyQuest mechanism out there that can has a 20ms average access time (the older mechanisms have a 25ms access time) The newer mechanisms are also supposed to be much more reliable (I will post details with my summary). By the way, the newer mechanisms have an orange LED instead of the red LED on the old mech.

Thanks in advance to all that respond
---jb

3725. My opinion of the comp.sys.atari.st.tech proposal

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 15:17:17 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <3113@rodan.acs.syr.edu>
Source record: 241465

IMHO:

I think the amount of traffic in c.s.a.s. is not large enough for splitting into any other groups at all. Of course it seems nice to have a seperate technical group, but anyone who has been using Usenet for a while knows that a good percentage of the articles will probably be posted to all of the ST groups, so we'll have twice the messages to wade through. People that just subscribe to one or the other group might be missing out on something. I also think that everyone has an interest in some technical issues as well as more general topics. Most people would subscribe to all ST groups, so would be reading cross-posted articles multiple times.

As the saying goes: "Don't fix something that works"

* Hear Hear !! *

A few others have noted how fast IBM came on to the scene - Remember -
the IBM PC was originally designed to replace the IBM Selectric typewriter
and break into a market that Xerox had a strong showing in: Word Processing.
Add to this the fact that IBM could throw literally millions of dollars at
their PC without feeling the impact - they did. The IBM PC was introduced with
the largest installed base of software of any completely new machine on the
market then and now. (Yes, I think they still hold that record!) Granted, noone
uses that software now - but it was something way back when... Clones
were introduced due to, (I think) IBM's arrogance.
You see, IBM musta figured "go ahead - let anyone TRY and build a machine
as good as WE can - nobody'll buy it" - they were wrong.

Now they have made a real blunder - they offered OS/2 - to replace an old,
patched, and ailing OS - let's hope that the likes of the Amiga, the MAC II's,
and the ST's can jump in there with real Power! :-)

3727. Midwest Atari swapfest report

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 16:58:22 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Apr23.165822.11005@chinet.chi.il.us>
Source record: 241474

Bob Brodie showed up at the Midwest swapfest on April 22. The big news is that the Megafile 44 is now in retail channels (one was given away as a doorprize). Both Portfolio and Lynx are doing well, but that's of limited interest to ST-ers. A trickle of STacy 4 machines are in US retail (music dealers only). It appears that TOS 1.4 is NEVER going to be shipped as original equipment on any machine (neither surprising nor important). The terms of the upcoming 520 ST promotion were explained: they'll be STFMs, and the promotion will be directed to department store sales. Also, while the pipeline is dry, mono monitors are available and should be getting out.

D. Brumleve (apologies for misspelling) was easily the darling of the event. she had a special on her line of Kid programs, and was giving out jumping disks. Anyone with children should get her stuff. Anyone with a printer should probably get Kid Publisher, children or no. She turns out to have some interesting an thoroughly worked out ideas about educational philosophy, which GREATLY affect the features of her programs. I don't agree all the way down the line, but she has 5 kids and I don't.

Everyone likes rumors, right? The stuff I liked best was conversations about what's going on at Mark Williams Company. Putting together various impressions from people who have different kinds of contact with them, it really looks like they could be back developing stuff for the ST in milliseconds if there was a decent chance of making money at it. And the bigshots at MW are said to get along well personally with papa Jack, which isn't all that common.
When asked about rumors of an upcoming new GDOS, Brodie said "You hear a lot of those rumors, don't you". And when asked about a possible higher speed ST, he said "I seem to have heard that question before". So no confirmation at all, but not enough denial to stop us speculating.
On the TT, the one thing he'll guarantee is that nobody at Atari can see any reason the TTp won't be for sale before this year is out. They may plan sooner, but when he's the one disappointed Atarians will take their disappointment out on, that's his date. Supposedly, the next guy with a chance to influence TT hardware design works for the FCC, not Atari.

I tried a program that uses the documented negative line A variable to detect mouse button pushes and that uses line A to draw points on the STe that was there: worked fine. The TOS 1.6 line A incompatibilities must be in other functions.
Steve J.

>As the saying goes: "Don't fix something that works"

In my opinion, the Atari newsgroup does NOT work. There is just far too much diverse and dissimilar information. As a result, I can't even set up a KILL file that gets rid of even 10% of what I don't want to read.

>Of course it seems nice to have a seperate
>technical group, but anyone who has been using Usenet for a while knows that
>a good percentage of the articles will probably be posted to all of the ST
>groups, so we'll have twice the messages to wade through.
Not if your newsreader either handles read crossposted articles correctly or if you have a KILL file in which you can put "/comp.sys.atari.st.tech/h:j" The only other solution would be for people to put keywords in the subject line, similar to what is done in rec.arts.tv.soaps.

>People that just
>subscribe to one or the other group might be missing out on something.
I doubt that I would. If an article is posted to the technical newsgroup, I probably wouldn't care. Even if there is the occasional article that I would miss, I would much prefer to have the built-in separation so that I don't have to worry about wading through all of the articles that I know that I don't have interest in.

>I also think that everyone has an interest in some technical issues as well
>as more general topics.
Nope. I don't care about technical articles as I don't do any ST-specific programming. I would welcome a technical newsgroup as a way of restricting the articles that I have to see.

>Most people would subscribe to all ST groups, so would be
>reading cross-posted articles multiple times.
See above remark.

I would wholly support the division of the Atari ST newsgroup into many more specific newsgroups. How about comp.sys.atari.st.emulator for PC-Ditto, Supercharger, Spectre, etc. discussions?

3731. JRI Board

Newsgroup: comp.sys.atari.st
Date: 1990-04-23 19:33:12 UTC
From: cr1@beach.cis.ufl.edu
Message-ID: <22971@uflorida.cis.ufl.EDU>
Source record: 241466

Due to a LARGE number of replies from all over the world about the JRI board, i thought I'd post a reply here about it, as promised.

(Sorry this took so long, the Gould went down for a few days , and I lost access to NEWS, how awful!)

Before I get into it, this is just my opinion of the board, I do not work for JRI or its competition.

The JRI Ram board uses SIMMS to upgrade your atari st to up to 4 megs. You have to use at least 120 ns 1 meg x 8 low profile SIMMS. These simms can be mail ordered for 69 to 100 dollars, I got 80 ns simms for 85 dollars. If you want to go to 1 meg, you can use 256k x 8 simms, but that is only good for you 520 people. Otherwise, the next jump is to 2.5 megs, then to 4 megs. Yes, it bypasses half a meg of onboard memory if you are using a 1040 ST. This means you get 2 1 meg simms and bypass half a meg of on board memory, going to 2.5. If you expand to 4 megs, you bypass the entire onboard memory, so you need 4 1 meg simms. You do NOT have to fill in the entire simm board (JRI board) with simms...I mention this because someone asked this specifically.

For those of you contemplating an upgrade, I had a problem with my mmu. It seems that MMU's with part number c100109 MAY have a problem with addressing more then 1 meg of memory. It is suggested that you replace it with part number c025912-38. My local atari store had a problem getting one. What I did was open up a STart magazine and look in the back where it lists Atari dealers. Call down the list until you find someone with an MMU available. Didn't take more then 2 tries. They sent me a Mega MMU and it works just fine in my ST. (1040 ST...did I say that?).

I did not do this mod myself. It is my opinion that the documentation provided could have been much better. It involves placing in some jumpers and removing some resistors. There was, in fact, an error in the documentation provided to me, luckily the guy working on it caught the error. This was probably a typo. Unless you are good with electronics and have worked on an ST before, I don't suggest you do it yourself, but then I am not very confident with that sort of thing.

I went to 2.5 megs with my 1040 ST. The memory works just fine, I have no errors or problems. The best thing is the board is small...it fits right under my keyboard, and I can even put the case on! This is a plus for those of you with things already in your st like a tweety board, pc ditto ii, etc.

If you buy the memory board, for a small amount of extra cash you can get the color mod. The color mod is a very small board with another video shifter on it attached to the memory board by a ribbon cable. You have to remove your video shifter (SOME ST's have the video shifter soldered in...mine did. They have LOTS of pins...not easy to remove...) and put the shifter into another slot in the board, right next to the provided shifter. then, put the board into the old space your shifter was originally in. I had to install a couple of sockets to raise it high enough to avoid hitting the other components, but that was no big deal. Let me tell you, the colors work great! I have tried Space Ace using it, and it does indeed use the extra pallete. No extra software is needed to use the extra colors with the game...just put the game in and boot up normally. I also tried Full Metal Planete by Infogram , wich also uses the STe colors, and it did indeed see the extra colors! This leads me to believe that any STe / ST game that uses the STe colors , the color board will take advantage of, but dont quote me on it.

For those of you interested in getting info from John Russel Innovatios, here is the address:

John Russell Innovations
PO Box 5277
Pittsburg, CA 94565

Or call (414)458-9577

Like I said, the only complaint I have about it is the docs could be better. 2.5 megs is SO nice...

Oh, price! The board cost me 125 dollars, that is without simms, and it was 25 extra dollars for the color mod. The color mod will cost you more if you do not buy the memory board with it. You can get SIMMS from JRI, I believe.

>>Also the ROM TOS 1.0 in all machines at FU Berlin's physics department.
>I tried the posted program on a 1040st with TOS 1.0 in ROM and it did
>clobber files with the same name as the directory I was trying to
>create while returning successfully.

What is your (collective) point? I didn't say this didn't happen in
original TOS (1.0), just that it's not in GEMDOS 0.23! And it's not.

This is even documented: Rainbow TOS Release Notes, August 7, 1989,
page 37:

"Attempting to Dcreate a directory with the name of an
existing file will return EACCDN. Previously, it would
delete the file, then create the directory."

What threw me was the original subject line, saying this bug was in
GEMDOS 0.23 (Which is Rainbow TOS's GEMDOS). It's not there, and it's
documented as a change, and the previous, undesired behavior is also
documented.

If your subsidiary doesn't make the Rainbow TOS Release Notes document
available with TOS 1.4, you should take it up with them. It's part of
the developer's package in the USA.

Hi folks, just a couple of comments/queries.

1) I have tried Gemini, I love it but I love G+plus more, has anyone yet found a way of using G+plus with different assign.sys files (as per usual) under Gemini, other than that Gemini is great. O.K. as someone has said you could have a general assign.sys but some fonts are unsuitable for other uses e.g. the music fonts for Take Control's Music DTP program. So please Gemini people teach it not to hog GDOS (In fact you could drop it alll together, the system font is not so bad). Thanks for the consideration.

2)Please can we hear more of Overscan, what does it work with, is it well behaved, what resolution can you get. Where can I get the instructions and most importantly how easy is the mod.

Thanks... Phil Woodall

WOODALLP@UK.AC.BHAM.VAX1 University of Birmingham Vax1, ENGLAND
*****VOTE LABOUR ON MAY 3rd*****
P.S. No flames on the above, I know its irrelevent and U.K. orientated, but there is little point in the huge extracts from books/songs/films either.

Tons of hugs.....Phil

Because with the new versions of Gulam and TOS 1.2 1.4, the bind keyboard command does not work anymore(unless I'm missing something). For me, the ability to rebind keys is an absolute requirement for an editor. In addition there are some very useful features missing in the short but sweet resident version in Gulam. MicroEmacs 3.10 can be customized to your desire to handle shell stuff with Gulam rather than the MWC shell. I have attempted to mail the Gulam authors about the problem but it always gets bounced back.

|
| Leroy J. Dickey, Faculty of Mathematics, University of Waterloo.
```

Well, one thing I've found is that the "me" built into gulam has difficulties with large files (>100K or so). I've found microemacs to be considerably more reliable - and faster.

Folks, a few things to keep in mind:

1) Please put news.groups in the Newsgroups: and Followup-To: lines of your
messages so they will get cross-posted to to where they really belong.
(Newsgroup creation guidelines dictate.)

2) The proposal is just for creation of one new group: comp.sys.atari.st.tech.
To "officially" discuss other new groups, you'll have to do another call
for discussion, which must be posted to news.announce.newgroups. For now,
let's stick to the discussion of c.s.a.s.tech and worry about creating
other groups later.

(and now, back to our regularly scheduled news thread...)

Does anyone out there have software to park the heads of a floppy disk?
I need it for a 5.25" add-on disk drive. Because of the faster step rate
in effect at boot time, if the heads aren't at track 0 the heads don't move,
the computer doesn't sense the track 0 signal, and comes to the conclusion
there is no drive there. Then, even when the step rate is changed to the
correct value, it's too late.

I don't have any documentation on how to write a program to do this or to
tell the computer that the drive is really present. Any help is appreciated.

3738. Fax for the Atari?

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 02:18:36 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Apr23.212539edt.57516@ugw.utcs.utoronto.ca>
Source record: 241469

Anyone in Netland have any experience with Fax for the ST? One of my
students asked if he could submit an assignment by Fax, so I guess
I have to start taking this seriously.

Rather than buy a stand-alone fax machine, it seems to make sense, for the
limited occasions I'll be using it, to use a computer based fax card and
external scanner. That way, the scanner could be used for desktop
publishing as well.

The one lead I have for fax machines that work with the ST
is a firm named Telefax, (thanx to Mark at Atari Canada for that lead)
but I'm a bit leery of using something that doesn't have local support,
and this machine is not (to my knowledge) available in Canada. Also, the
dealer was busy vacuuming when Mark phoned, and asked him to phone back
later. Doesn't exactly sound like a major corporation....

So the alternative (he said, putting on his asbestos suit) is to put
a fax card in my new MS-DOS clone, currently used as the world's largest
EPROM burner. This is attractive because there is a 9600 baud fax card
for the MS-DOS world, for $275 Cdn. (Frecom FAX96 card, recently reviewed
in 'The Computer Paper', out of Vancouver). One could then sneakernet
files between the Atari and the MS-DOS machine. I assume this would
work for outgoing ASCII files, but it requires that there be some way
to convert the fax bitmap on receive to something the Atari can show. The image
card can work with are .TIFF, .PCX or .FAX format.

The Questions (finally):
Has anyone out there got FAX to work on the Atari (Mega2 in my case)?
Are there programs to convert from some Atari image format (Degas would
be convenient) to something a fax can send?

I've used Gulam on files over 2 meg in size. The only other microemacs program
I have only works up to 64K. Gulam's is faster, and a little slicker to use.
(The other is the me that comes with MWC. Nice in it's time, but I stopped
using me+msh when I got gulam...)

3741. 1ST Word lockup

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 11:08:48 UTC
From: stefan@spcc386.UUCP
Message-ID: <594@spcc386.UUCP>
Source record: 241479

My favourite wordprocessor, 1ST Word (yes, 1ST Word!), has this little thing
that makes me want to grind my ST to a lot of little pieces sometimes.
I know it has something to do with the famous 'Phantom Typist'.
Sometimes, it falls into a complete coma and only the reset button will help.

I tried solving this by writing a little program that saves the current
WordPlus document after pressing ALT-HELP-SHIFT or something. It searches
memory for a document and saves it. But this was a nice try since I couldn't
figure out the format of a WP document in memory.

I wonder, is there a program or accessory that does timed 1ST Word backups?
Since 1ST Word is the only thing that locks up, I think I just have to wait
until the next backup and reset.

Now I am looking for a program like this or the format of 1ST Word documents
in memory so I can write it myself. If there is a program, where can I get it?

3742. Tech: changing resolutions without using desktop

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 13:30:33 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <18914@eagle.wesleyan.edu>
Source record: 241481

Hi...I have a technical question regarding switching resolutions on the ST. I'm trying to write a program to launch an application in low resolution from Gulam when I was in medium resoultion. I am using Setscreen, which seems to do half of what I need. But when I launch the application (or exit to the desktop) Gem still thinks I'm in medium rez so the windows are all in the wrong places and the mouse wraps off the right-hand side of the screen. How can I get around this? I assume there must be some way of notifying Gem that the resolution has changed and I suspect it has to do with changing the clipping boundaries.

Also, is there any way to locate the current palates for low and medium resolution in memory, or do I have to read them from Desktop.inf? If so, how do I find out where desktop.inf should be?

I'd look it up but I can't afford the developer's docs. Any information or code examples would be appreciated.

This problem was fixed quite a while ago.

I bought Laser C, and I have been using their resource construction
program, otherwise I would still be using K Resource.

The only thing that bothered me about K Resource was the
manual...while reading it, you got the feeling it was written
by some smug high school kid. It was not only unprofessional,
but a little nausiating as the author bent over backwards to
pat himself on the back...

It *is* a good program, though....

3748. attribute bits and bytes

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 18:03:26 UTC
From: ignac@electro.UUCP
Message-ID: <1652@electro.UUCP>
Source record: 241359

Does the Fattrib() system call OFFICIALLY support setting the system bit, write protect and hidden bits for subdirectories?? The GEM Desktop does not allow you to write protect subdirectories, so i am assuming that the system call will not allow you to change any of the attribute bits (if used unwisely, the subdirectory could concevablly be turned into a file! not a good situation!) by using a sector editor, i can manually set the hidden bit within the attribute byte of a subdirectory, and everything is hunkydory. the desktop correctly does not display the subdirectory, but using a commandline interpreter, i can still access the hidden directory.

does MS-DOS support this feature, perchance??

3749. Phantom Typist

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 19:15:45 UTC
From: wkk@cbnewsl.ATT.COM
Message-ID: <5342@cbnewsl.ATT.COM>
Source record: 241499

Well,
Atari may deny it but I too have seen the Phantom Typist.
This time I was running WordPerfect (Aug. 1989). Sure enough
after some hours usage the typing
rate slowed down. Gee!, and after I would type a character on the keyboard and
shake the mouse I could actually see the character on the screen.
Although the mouse pointer tracked the mouse correctly, I had to press
the mouse button several times to make a selection. This happened twice
each on two different days.

What is really scarry is that I have also seen this while using Spectre-128.
I was running PowerPoint and after a couple of rapid deletes (I generally
type too quickly and make a lot of errrors) the machine
responded in the characteristic Phantom Typist manner. I am going to
try and duplicate this when I get a change.

By-the-way the Phantom Typist caused me to loose about an hours work.
I now use the autobackup facility in WordPerfect.

I have had my 1040ST for about 3 years and I beleive I have seen this
"non" problem several times. Since I do not generally use the machine for
serious work, I took it in stride. However, I really can't trust is
for serious work, and I am sure that the other OWNERS want to see someone
explain this problem.

Aside from all the other ATARI'isms about future availablility of products
I like my machine, however now that the time is approaching to buy a
business oriented computer, I really don't think I will buy another ATARI.
I may buy a TT when it comes out, but with the current track-record,
it will be my fun machine for programming and the like, but not a machine
for serious applications.

I really don't care whose problem this is. If it's ATARI's fault then
fix it. If it is an application fault, please lets find out what people
are doing wrong. (What we really need is a small example program that
can be shown to exhibit the problem).

Wesley Kaplow
AT&T Bell Labs.

3750. Help, where can I get LINT

Newsgroup: comp.sys.atari.st

Source record: 241488

Netters,

Does anyone know where I can get a copy of LINT that I can use with
Sozobon 1.01 (I'd use it with 1.2 if I could get working binaries!)

I need it in sort of a hurry as I keep shooting myself in the feet and it
would be very useful to use it before starting another long error doomed
compile!

Also, does anyone have any short comments on how to use MAKE? I have split
my main program up so that it covers a number of smaller .c files, but at
the moment I am doing the following:

#include "filename.c"

I realise that this is possibly not the best thing to do as I am constantly
recompiling code that is tested and debugged, so I need help!

All replys welcome, either by Email or through this digest (I think that
enough other people may find this information of interest.)

Regards,

Simon.

3751. uuencode

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 20:21:20 UTC
From: frech@MWRAAA.ARMY.MIL
Message-ID: <9004250707.AA10987@ucbvax.Berkeley.EDU>
Source record: 241489

Greetings,

I am looking for the author, source, etc of the version of uuencode, uudecode that runs on an ST. I mainly interested in seeing if this version can be ported or has already been ported to System V. The version I currently have does not have all the neat features of the ST version and I am very interested in a port to System V. If none such exits, I am willing to try a port myself if I can get the source.

Please post to me directly as I do not receive this digest.

Thanks,

Norman Frech <frech@mwraaa.army.mil>

3752. Clearing the screen

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 20:45:00 UTC
From: CPIAZZA@UMES.UMD.EDU
Message-ID: <9004270923.AA02427@ucbvax.Berkeley.EDU>
Source record: 241490

I have a question that probably has been aswered before, but since I
didn't see it before I'll ask anyway. My problem is this: I'm trying to
write a GEM application using the AES and VDI routines. The AES manual
states that after a dialog or alert box has been interacted with and closed,
the appliction must respond to a WM_REDRAW message from the event handler.
The AES manual goes on to say that this may be done by "...a series of
VDI calls."

Well, I can get the WM_REDRAW message from the event handler ok, but how
in the world do you redraw the screen. From playing around I gather it
has something to do with the rectangle list and some raster operations.
I think I understand how to get the rectangle list...but what about the
raster ops?? Anyone know?? I'd prefer if you sent mail (with examples
if possible) directly to me at CPIAZZA@UMES.BITNET

Thanks much!

3753. summary of responses: changing resolutions

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 21:52:13 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <18997@eagle.wesleyan.edu>
Source record: 241492

Many thanks to all who responded to my question about resolution switching, and to Dave Baggett for the information on finding the palette. The people who wrote me all said some combination of the following things:

1) You can't do it. This is not a supported operation in Gemdos.
2) A soft-boot is the only supported way to get Gem to recognize the new rez.
3) If you do manage to do it, it will be based on undocumented locations which are subject to change in future OS versions.
4) Its probably a bad idea anyway
5) Programs which do change rez on the fly change back to the original rez before calling dialog boxes or other GEM stuff.
6) Several of the respondents asked me to let them know if I got anywhere with it.

Well, I spent a few hours today hacking around and looking through memory maps and aline.h and such, and found no clues. It seems to me that the only 2 things that get screwed up are the color palette (at least in gulam, the text turns yellow when you go med -> low) and the positioning of the dialogs. Assuming Gem uses some memory location somewhere to determine the current maximum X pixel value, it seems to me that a kludge would be easy. I'm not looking for super-portable code, just something that _WORKS_ on Tos 1.0...If the right locations were known for various configurations, a very simple program that works with the undocumented locations on different OS versions would be feasible. If anyone has ANY idea where I should start looking, please let me know. Although I realize Atari is really into sticking to documented ways of doing things, I'd really appreciate any help Allan Pratt or anyone else could give me. The main reason I'm dying to get my hands on a way to do this is it's really hard to develop low-rez software because I have to edit in med, switch to low to test, switch back, etc. which means exiting gulam each and every time. Also, the few programs I use which are low-rez only require me to go back to the desktop for the same reason.

Yours for useful kludges,
nick

Source record: 241500

A few people have requested this, and it has bounced back at me from a
couple of addresses in mail, so I am posting it here. It is an article
describing how to add audio ports to an ST.

enjoy,

=-=-=-

discharge that can be felt is at least 6000 (or is that 3000, I don't remember for sure, still, it's quite high) volts. A discharge of as little as
60 volts can blow modern electronic circuits. Simply raising your arm while wearing a jacket can develop a charge of 2,000+ volts. (these figures are from 'The Dangers of ESD' Apple service training video)
Fortunately, there is a low cost alternative that should do nearly as good of a job. (I've used it with no damage to several machines that I have worked on at home) Take a cover your work surface with a damp towel (not *soaking*, just damp). Take some light, flexible wire, strip it's insulation, and loop it around your wrist, so that it connects your wrist to the towel, thus balancing the charge between the towel and yourself. Run another similar wire from the towel to the screw that holds the panel on an electric socket. This will drain excess charges to the ground (do *not* not put the wire into the socket, I don't want to get sued because someone read this and plugged themself into 120volts! Also, *never* repair a monitor while grounded, it makes it that much easier for the CRT to discharge and *KILL* you!)

The first step is to decide where to put the plugs on the case. I installed mine to the left of the monitor cable, above the RF modulator. I have on older 520 ST (w/1meg ram). On newer STs which lack the RF modulator, there should be plenty of room to the left of the monitor plug (assumming the modulator space was left vacant, as it was on 1987 1040 STs)
Next, it's time to disassemble the machine. Start by wearing your wrist strap, and making sure the mat is grounded. Set the ST (with nothing plugged into it) face down on the mat. Next remove all of the screws from the bottom of the case. Now, while holding it all together, flip the ST over, and remove the top cover. The keyboard can now be easilly lifted away. You will find that it is connected to the motherboard by about 20 wires that lead to a connector. Carefully slide the connector off of the motherboard (don't bend the pins). Thenext step is to remove the radio shield. Take out the screws which hold it to the motherboard, and then use the needle nose pliers to sraighten the tabs that hold the shield down. The shield will then lift away.
Now is the time to cut the case. drill or cut the appropriate sized holes,and mount the RCA jack(s). Make sure that they are not in a position where theywill touch other components, and that they will still allow the cover to fit.
Now comes the soldering, if you hav ANY electrical soldering experience, this will be a snap. If not, find somemone who does to give you some pointers. I won't go basic soldering and wire stipping instuctions here, because I'm
assuming that anyone who is willing to do a hardware hack on their ST, probably can hold their own with a soldering iron. If you are putting two jacks into your ST, you must solder a short wire between the outside leads of each jack. Another short wire should connect the inside leads of the jacks. Since connecting the jacks to the motherboard will mean that it is (somewhat) permanently wired to the case, you may want these wires about a foot long each.
Solder one long wire from the outside lead of one of the RCA jacks to a ground on the motherboard. Since the signal ground on the monitor plug is hard to reach from the top of the board, I simply soldered mine to the metal case on theserial port. This seems to be abouth the easiest plece to put it, and I highly recommend it. The another wire must be soldered onto the inside lead of one of the jacks. The other end of this wire needs to go to the audio line on the monitor plug (pin 1). Pin one

is on the top left (when facing the plug from theback), and it's lead (at least on my ST, they may have changed brands of plugs since 1986) is on the top right when facing from the front of the machine, and has plento of room for the wire to be soldered onto it.
That's all there is to it, just put the ST back together opposite the way you took it apart, (make sure the keyboard cable is facing the right direction,and don't force it) and you'll be set. The entire mod can probably be done in less time than it takes to read this article. Just slap a 2 line stereo patch cord on the ST, and hook it to the external input jacks on a stereo, and you're all set.
I have recently been told that pin 2 on the monitor plug (the next one overfrom pin 1) carries an NTSC composite video signal. I haven't had time to checkthis out yet, but if it is true, the above procedure will yeild a video port which can be connected to a VCR (to record, or display on a TV) or a composite monitor (I don't know why you would want to).
BTW, Atari lists pin 2 as 'reserved'.
Well, I hope this is of help to someone, I didn't expect it to be so long winded when I started.

3755. Reg. Exp. Parser

Newsgroup: comp.sys.atari.st
Date: 1990-04-24 23:43:05 UTC
From: djd1@csug.cs.reading.ac.uk
Message-ID: <2317@onion.reading.ac.uk>
Source record: 241494

Hi there.
Can anyone tell me where I can find a PD regular expression
parser ? I have heard rumour that something called 'regex' is floating
about somewhere, but I can't find it at any archive site.

Many thanks,

Dave.

[This message is being forwarded from Michael Ritzert, mjr@dmzrzu71.bitnet]

All this should be the purpose of the newsgroup you sent this posting to. I think we should stick to this single one. We have lost too much by splitting off the discussion on Minix-ST from this group. And, please, also consider that Your proposal will effectively a renaming of the present group --- after a relatively short time interval info-a16 will have disappeared and all the atari bashing and whining we want to get rid of will reappear in comp.sys.atari.tech.

Another issue: how many newsgroups do You want to read? Where do You take the time to follow, say, 20 forums?

>
I agree completely here, if there was a comp.sys.atari.st.prog and/or
comp.sys.atari.st.wizards/tech, I would drop this current newsgroup
immeidately.. There is always too much bullsh** on this group.
Lets face it, complaining to each other is not going to achieve a damn thing.
A newsgroup even if moderated would be fine where the likes of the real posters
post(Chu, Dickey, Pratt, Ken B., Small, the list goes on, sorry if I missed some)

then again, traffic doesn't seem to warrant a group, so a moderated group
would probably be best, which would eliminate annoying posts..

thats my 5 cents worth..

Don't bother. There is NO (TOS-legal) way to switch resolutions _and_
have GEM recognize the switch. All the GEM-oriented variables and stuff are
set up at startup/reboot, and are not meant for mortal men.

If you want to write resolution-changing code that doesn't use GEM, no
problem. Setscreen() won't care. If you want to use GEM, however, forget it.
I've spent a similar number of time at the problem (yeah, I program on a color
monitor too B-), and I finally accepted defeat. Learn to live with
compile/link/save/exit/switch/run/*crash*/switch/load/compile...

And the reason you are having "color change" problems is that the GEM
numbering of color palettes does not correspond to TOS's numbering of
color palettes. Just because the second color palette contains dark red
in TOS doesn't mean you can you GEM color #2 and get it. I suspect that Atari
GEM remaps the TOS palettes to comparable GEM values to maintain compatability
with Digital's original GEM definitions (DRI GEM was started up on IBM PC's
without alterable color palettes, I believe).

Source record: 241496

I posted this message previously, but I do not think it ever arrived. Beckemeyer uses the ARGV= protocol with ARGV pointing to a status string for the various file handles, followed by av[0]...av[n], while Gemini (the newer version) has ARGV pointing to av[0], followed by av[1] ... av[n]. This is, obviously, a fatal difference. Who is right?

Take a look at the printer port. It is bi-directional (but You'd have to program it Yourself) and pretty simple. If You want to use buffers, You'd have to find a "direction"-line; the GPO-bit (availeble on the monitor connector) could be used.

> The question is this:
>
> Is it possible to set the cartridge port as a user port that allows
> reading and writing? All the diagrams I have see indicate that this is
> possible.
> If so how do you do it?

Its not that easy: writing to cartridge port adresses results in no DTACK or VPA, so the monoflop in the GLUE times out and issues a BUSERR.

Common solution is to "write by read"; the trick is a combination of a little latch and the adress register indirect with offset adressing mode of the 68k: put the data to be written in a data register (say, D0) and the base adress of the cartridge area in an adress register (A0 for example).
Now do a read of a reserved adress of the cartridge area (to put the external hardware in "attention" position) and then do a read of the adress combined of a0 and d0 (tst.w (A0,D0)).
let a latch in the external hardware catch the lower 8 bits of the adress bus and carry it to the outside world: You have "written" throu the cartridge port.

reading is much more simple :-)

> If the above is true, is possible to set it up as two seperate ports,
> one that is a read only port and a write only port. having done that can they
> be used together at the so time i.e. read from one while the other is being
> writen to?

Sure.
You have 9 adress lines to be decoded. Just use 2 seperate adresses to select either port (and design the otehr one to keep quiet).

>Also, the few programs I use which are low-rez only require me to go
>back to the desktop for the same reason.
>

I've got a program called STSWITCH written by David T. Jones which can be used for med-low res development. On boot-up it splits the RAM of the ST in two and gives you, effectively, two machines. You can change resolutions independently, have two desktops, run two applications, the works! You switch machines by pressing CTRL+both shift keys. What it then does, I think, is a massive block switch to swap the machine in high memory with the one in low memory.

Your development process would then be:
1. Boot up.
2. Run the switcher to activate the magic keys
3. Load your shell, etc into your medium res machine
4. Switch to the other machine and use "SET PREFERENCES" to get into low res.
5. Do your work in the medium res machine and after compilation to disk, switch to the low res machine to test.

This then cuts out the need to switch off the machine or quit you development environment. I'm not sure if it will work with disk cache programs - I don't think so.

I just tried to get it working with gulam, but gulam seems to use its own keyboard handler and the mouse dies when you switch machines.

Anyway, if you can tear yourself away from gulam and use a lesser shell then things *may* work out fine.

Warning:
If GEMDOS gets its FATs mixed between machines then the next time you save your source code will be your last. Get up a directory before you safe (and make sure it's a NEW directory; not a cached one).

A word from the author of STSWITCH (taken from the docs):
"Firstly, please don't take it too seriously. STSWITCH is not the most reliable and user-friendly program in the world, it isn't too happy with colour systems and doesn't like many graphics programs! If you push it too hard IT WILL BREAK! But, hey, it's free, who

cares?!"

Who cares indeed. If you want to save time then it's worth a try and even if it doesn't work you have an auto-booting program which asks you if you want to halve your memory. Something I do all the time :-)

>Yours for useful kludges,
> nick
>

Kludge? Naaah... It's a feature.

Dave.

May be your mouse cable is broken. This makes the mouse response awful, until the mouse breaks down and there is no more response. Because the cable moves the error is not stable. Try what happens, if you stretch the cable. But do it careful. I had that problem for several months until I had to recognise, that the mouse keys did not work and the pointer moves only in one direction.

Knut Grunwald

3764. Re: Proposed change to names of sources/binaries postings

Newsgroup: comp.sys.atari.st

Message-ID: <RALPH.90Apr25120942@orion.laas.fr>
Source record: 241351

In article <1588@male.EBay.Sun.COM> koreth@panarthea.ebay.sun.com (Steven Grimm) writes:
| Someone has suggested that since software to automatically save news articles
| using the filename in the "Archive-name" pseudo-header line, I should stop
| calling the articles program/part01, program/part02, etc. and start calling
| them program/program.uaa, program/program.uab, and so on. This would enable
| Dumas uud to pick up the parts effortlessly.

In article <11706@stag.math.lsa.umich.edu> hyc@math.lsa.umich.edu (Howard Chu) writes:
| No changes to the Dumas uud program are necessary. The program is pretty
| smart, it does a two-part search for the continuation files already. First
| it looks for the named file, e.g. program.uab, but if that file doesn't
| exist it merely continues to read its current input file. So, to decode a
| multipart posting, merely
| cat part* | uud
| and you get the output file, no muss & no fuss.

Rather than stop calling the articles program/part01 as Howard has
suggested above and in <1599@lzsc.ATT.COM>, making references to the
breaking of software, I suggest an alternate Article or Archive header
in some form similar to:

Filename: foobar.uaa

If an optional header is acceptable, a) current software would not be
broken, and b) software could be written, by those who want this
feature, to automatically save the file under the given name.

Wishlist: for all those news hackers!!

What I would like, under either rn or gnus, is to be able to specify
the articles which make up some piece of software, and then have the
news software pipe the parts in the proper order to uud or unshar,
since it can accept the parts on stdin. That way, no more messy
intermediate files to fiddle around with.

Oh well,

>

I know there is no TOS-legal way to do it; as I said, many users wrote
to tell me that. I am, plain and simply, looking for a TOS-illegal
way to do it. If all the variables are set at boot-up, they must be
set SOMEWHERE so finding them would hopefully allow some sort of
kludge. Gods insist on doing everything by the book; mortal men
settle for something that works.

An idea for anyone else who is working on this who hasn't yet been
discouraged... perhaps the routines which do all this setting of these
hidden Gem variables after bootup could be found and called from a
program? That is, instead of changing resolutions and soft-booting to
get the routines to do their stuff, if you could locate the routines,
change resolutions and then call the routines, it may do the trick.
This assumes a) that one can find the routines [yes, I know this would
be non-portable] and b) that this wouldn't confuse the hell out of
Gem, which it probably would to some degree.

Well, running DESKSET after the resolution change fixes the color, so
I assume a workaround for this will be easy. I have noticed that
TOS/GEM numbering schemes are different, but is this really the reason
why the colors get scrambled after resolution change using Setscreen?

P.S. I am graduating in three weeks, so I lose net access (at
least for a while), therefore I have to finish this by
that time.

3767. DEC LK201 keyboard driver & TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 11:35:05 UTC
From: knop@duteca
Message-ID: <769@duteca.UUCP>
Source record: 241386

Some time ago Mark Boyd (mark@ncsuvx.ncsu.edu) posted the mods necessary to connect a DEC LK201 keyboard to an Atari ST computer. I have applied them and they worked fine, except for some simple errors in the character scan-code table, which I fixed.
By the way, if you connect the 'wrong' end of the LK201 keyboard cable to the keyboard, the colors of the wires are different! Do it wrong and you can fry the keyboard (I did it right.) The long uncurled end should be connected to the LK201 keyboard.

Since I upgraded from TOS 1.0 to TOS 1.4 I can no longer use the driver for the DEC LK201 keyboard. (TOS 1.2 does not work either.)
The driver program hooks itself into the interrupt vector of the MIDI ACIA. This vector is apparently the same as the vector for the keyboard and the mouse. (I remember lock-ups using minix with a MIDI instrument connected to MIDI in.)

After the keyboard driver has been loaded, any mouse movement causes a reboot. Pressing a mouse button or any key on the Atari keyboard, or the LK201 keyboard has the same effect. Sometimes I can see 4 bombs that are erased immediately as the system reboots. (It is my feeling that this is a design fault in all TOS versions. A fatal error should be reported to the user in a _reliable_ way.)

It seems that the keyboard driver installs successfully (it initializes the MIDI ACTA, reserves some memory space to live in and TSRs) as the computer does not crash until the first interrupt when the driver has to do some real work. At that time it should call both the midi handler and the keyboard handler repeatedly until there is no more work to do.

If I read the assembler code of the driver correctly it assumes that address $de8 contains the address of the MIDI handler and that address $dec contains the address of the Atari keyboard (with mouse) handler.

To stuff the characters from the LK201 keyboard in the TOS keypress buffer the LK201 driver calls a routine at $fc2aa6. This probably only works under ROM TOS 1.0. However, this routine is not called for Atari keyboard and mouse interrupts (I think). Therefore it does not explain why the system crashes when the Atari keyboard ACIA interrupts.

The LK201 keyboard driver sets and clears some bits at address $e1b when a shift or control key is pressed or released. It seems that the system crashes regardless of the state of shift, control and alt keys (although pressing any of those keys will crash the system).

Obviously I want to use the LK201 keyboard with TOS 1.4. You can help me if you can answer any of the following questions, or can provide any

other relevant information.

Question 1:
Can the addresses of the MIDI handler and the keyboard handler still be
found at addresses $de8 and $dec ? If not, how/where can I find these
addresses in the different TOS versions ?

Question 2:
How/where do I find the address of the function that stuffs one charac-
ter in the keypress buffer in the different TOS versions ?

Question 3:
Does address $e1b contain the state of the shift, control and alt keys
in all TOS versions ?

Thanks for your attention

>By-the-way the Phantom Typist caused me to loose about an hours work.

I've often encountered the Phantom Typist using WordPerfect under TOS 1.0.
I've never lost work though -- all key strokes get processed eventually,
so when the PT strikes I enter a save command and go get a cup of coffee.
Then I reboot and continue with my document.

So the secret is -- be patient.

> have any info r.e. the extra BIOS/XBIOS calls which are provided in these
> versions of the ST ROMS.

Well, I have exactly the same questions, and in a recent vacation, decided to take the ROMS apart. Armed with a trusty copy of INTERNALS, I jumped in and have taken a look at the new STE code, extensively to look for how to operate the new joystick ports.

The result of this is a big text file, containing what I managed to discover. It includes details of how the ROMS were dumped [not as easy as it sounds!], the changes to TOS, GEM, etc I noticed [not much, but its a start] and my goal, where the new 'enhanced' joysticks reside, and some of how they work. Without the Official Atari docs I can't check this, but there's a lot of info that I'd like to pass on.

Here's a quick summary off the top of my head before I get round to posting the detail:

- The ROM has moved down from $FC0000 to $E00000, and is now about 198K [was 192K]. This could have some implications for the more adventurous memory upgrader.

- From what I can see the only changes in the code for the new hardware is additions in the startup code [eg to silence the DMA sound].

- I could find only one change to the calls [XBIOS, BIOS, GEM...]. This is an extra XBIOS call which I can't figure out. It does some strange things like redirecting the bus error vector, which made little sense. [I reached these conclusions after looking at the jump tables and searching for references to the hardware locations]

- The new joysticks provide 2 analogue inputs [using 555 timers as V-F converters!], and lines for 4 extra sticks. These not only give 20 inputs, but 8 lines are bidirectional. I've already got the STE understanding my VCR's remote and Tx'ing to the VCR without a hack to the cartridge port in sight! The analogue lines disappear into a custom chip so my hopes of _PROPER_ joysticks [not switched] and ADC ports will have to wait for Atari to publish. That is unless someone out there knows...

The only problem I have with posting the full details to the net is its size- much larger than the average one page message. What's the best way to do this? Being a newcomer to the scene I'd hate to jamm someone's modem out there or be barbecued alive for posting jibberish. Is the intrest out there to warrant the net bandwidth? I'll finish the file, and wait a couple of days for any opinions.

If anyone's interested I could also mail them the stuff I did for the infra red remote control using the STE. Its at the protatype stage [68k code- forget menus and text boxes!], but the hardware's there and working.

Share and Enjoy!

Due to the problem that GEM has with switching resolutions, I have been writing code that works in both low resolution and medium resolution. This way I can do most of my debugging without switching to low resolution.

AG has acknowledged a bug with the date and time util. It still works
okay, but PCD II software trashes the date after it gets it.

BTW, I have noticed that if I use Control-Alt-Delete to restart DOS, that
the time loaded into DOS is not correct. It loads the time that I first
started PCD II from TOS. Another bug, I would assume.

3774. Official bug fixes #3 and #4 for Sozobon C 1.2

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 15:11:34 UTC
From: mj@myrias.com
Message-ID: <641056295.5414@myrias.com>
Source record: 241388

```
Please find included another patch from Johann Ruegg. Please better
apply.
Michal Jaegermann
mj@myrias.com
>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Two more bugs have been found in Sozobon C 1.2. Here are the fixes.
(I have previously reported 2 other bugs, so these bugs are numbers
3 and 4)

::::::: bug fix #3 ::::::::::::

The first bug is in 'hcc'. It involves passing arguments of type
char or unsigned char. This may fail if the arg is an expression
(and is inefficient for register variables).

First, add the following line near the top of file 'g2.c':

#define isdreg(np) ((np)->g_token == REGVAR && (np)->g_rno < AREG)

Second, in the function 'onearg()' in g2.c, change the following case:

case 1:
addcode(np, (np->g_ty == ET_U) ?
"\tclr.w\td0\n\tmove.b\tA,d0\n\tmove.w\td0,-(sp)\n" :
"\tmove.b\tA,d0\n\text.w\td0\n\tmove.w\td0,-(sp)\n" );
return 2;

to this:

case 1:
if (isdreg(np))
addcode(np, (np->g_ty == ET_U) ?
"\tand.w\t#255,A\n\tmove.w\tA,-(sp)\n" :
"\text.w\tA\n\tmove.w\tA,-(sp)\n" );
else
addcode(np, (np->g_ty == ET_U) ?
"\tclr.w\td0\n\tmove.b\tA,d0\n\tmove.w\td0,-(sp)\n" :
"\tmove.b\tA,d0\n\text.w\td0\n\tmove.w\td0,-(sp)\n" );
return 2;

:::::::: bug fix #4 ::::::::::::::

The second bug is in 'top'. It happens infrequently, but it does occur
in 'jas' source. Look for the following lines in 'peep2.c':

/*
* move.x X, Y => move.x X, Rn
```

```
* move.x Y, Rn move.x Rn, Y
*
* where Y isn't INC or DEC, and isn't register direct
*/
if ((op1 == MOVE) && (op2 == MOVE) && (i2->dst.amode == REG) &&
opeq(&i1->dst, &i2->src) && ((i1->dst.amode & (INC|DEC)) == 0) &&
(i1->flags == i2->flags) && (i1->dst.amode != REG)) {
```

Change this to the following:

```
/*
* move.x X, Y => move.x X, Rn
* move.x Y, Rn move.x Rn, Y
*
* where Y isn't INC or DEC, and isn't register direct
*/
if ((op1 == MOVE) && (op2 == MOVE) && (i2->dst.amode == REG) &&
opeq(&i1->dst, &i2->src) && ((i1->dst.amode & (INC|DEC)) == 0) &&
(i1->flags == i2->flags) && (i1->dst.amode != REG) &&
!uses(i1, i2->dst.areg)) {
```

```
::::::::::::::::::::::::::::::::
```

After making these changes, recompile as usual.

3775. An old fix for a previous version of jas

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 15:14:06 UTC
From: mj@myrias.com
Message-ID: <641056448.5555@myrias.com>
Source record: 241389

After I mentioned in my other posting an existence of an old fix for
jas requeststst are still coming. Therefore here is a relevant fragment
of a message which was posted nearly a year ago. Please note

*** this is a fix for jas in a PREVIOUS version of Sozobon C ***

I have to admit thet I did not check if this was corrected in
a 1.2 release, but I presume that yes.
~~~~~~

'btst' instruction with an immediate operand has problems in a Sozobon
jas assembler. The assembler inserts into produced machine code an
extra word creating slight indigestion.

I turns out that exactly the same problem affects not only
'btst', but also 'bchg', 'bclr' and 'bset'. A reason for it seems
to be a simple typo in a file opcodes.h. To fix it replace the
following lines from that file (they are NOT consecutive)

```
{"bchg$s", O_IMM, O_DN, S_L, "x0o41%1e", F_L },
{"bclr$s", O_IMM, O_DN, S_L, "x0o42%1e", F_L },
{"bset$s", O_IMM, O_DN, S_L, "x0o43%1e", F_L },
{"btst$s", O_IMM, O_DN, S_L, "x0o40%1e", F_L },
```

respectively with

```
{"bchg$s", O_IMM, O_DN, S_W, "x0o41%1e", F_W },
{"bclr$s", O_IMM, O_DN, S_W, "x0o42%1e", F_W },
{"bset$s", O_IMM, O_DN, S_W, "x0o43%1e", F_W },
{"btst$s", O_IMM, O_DN, S_W, "x0o40%1e", F_W },
```

Now we are getting somewhere.
Previously, everyone is looking at TOS for the problem.
If it truely moved to Spectre, then it is in the intelligent keyboard.
Not supprising, as it handles the mouse also, and mouse moves wake it up.

OK German hot-shots (hope that translates gracefully) what do you think?
Is it a program problem in the Keyboard computer.

AN Afterthought.
If the problem is in the keyboard, then if the machine state is saved
(Switch-Back can do this, probably other switchers as well) and the
CPU rebooted, and the program reloaded, then it should RUN well.

3777. TOS 1.4 -- A Problem/Feature

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 16:06:08 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1668@lzsc.ATT.COM>
Source record: 241357

I wish to describe a feature of TOS 1.4 that I have been forced to acknowledge.
(You know, a feature is a bug that won't be fixed).

TOS 1.4 desktop attempted to get the "current directory" straight to help
finding RSC files. This is what is left.

To show the problem:
1.
At the desktop, open 2 windows on C:.
In each window, open a different folder.
2.
Call the windows A and B.
The current window (foreground) is A. the other one is B
3.
Click on window B.
Many programs in this window will not be able to run because
they attempt to find a file in "the current directory", and
a Dgetpath() will show that that is for window A.
EX. MSH cannot find profile; Spectre cannot find driver; etc.
4.
After this attempt to run has failed, usually a benign bomb, the
desktop is refreshed, and the path is now corrected.
Now the program will run if clicked on.

I purchased SmoothTalker from E.Arthur Brown.

I like the program, It is what I was looking for in a Text -> Speech Program.

QUESTION:

I've been unable to read in a standard Text File. It appears that
the file format for smooth talker has no line-feeds.

Does anyone know the format, and/or have a Conversion Program?

Thank You,
-Patrick

I missed the original post (we lost our news feed for about 3 weeks --
curses (and not the graphical kind)), so I don't know how much of this
has been covered. Sorry if I'm being repetitious.

STalker is not exactly new; I've been using it for about two years
(the version I currently have is 2.03). I love it. It's so damned
convenient to be able to download comp.sys.binaries.st in the
background while I'm working in WordPerfect that I haven't dusted off
Uniterm for months.

As far as I know, STalker is fully VT100 compatible with the exception
of inverse chars, which have been omitted to save on internal buffer
space. (STalker's text buffer is configurable from a minimum of 80
cols X 24 lines to as big as available memory; it's fully scrollable,
and portions of the buffer can be marked with the mouse and printed,
saved to disk, or passed to the companion text editor accessory STeno.
Leaving out the inverse char attributes results in a substantial
saving in buffer size, and I don't really miss them.)

Stalker's RS232 parameters menu includes settings for 19200 and 38400
baud, but I can't confirm that they work, since I can't currently
afford anything faster than the 1200 baud modem I'm using. :-(I

think that STalker itself _doesn't_ rebuffer the serial port, but an \AUTO\ program is included which does expand the RS232 buffer (recommended for use with ymodem of xmodem-1K downloads in the background).

I suspect that background downloads would work fine at 19200, but David's likely right that the GEM text window wouldn't be able to keep up at that speed -- without flow control you'd run into problems sooner or later. As long as your host supports XON/XOFF flow control (or RTS/CTS if you have TOS 1.4), everything should work fine. Given that STalker only costs $35 or so, it's certainly worth a try.

Yet another "feature" of TOS 1.4.

I use wildcards in desktop.inf to display only part of a folder.
I find that two such, as in P*D*.prg does not work. OK, so I'm limited
to one *.
Now I find that 2*.prg works, listing only programs starting with 2.
BUT, *2.prg, which should find programs inding in 2, like pcditto2.prg,
list none of these; but does list pc_d.2 !

Now that is a feature!

>av[n]. This is, obviously, a fatal difference. Who is right?
>
The scheme you described Beckemeyer using is that used by the Mark Williams runtime code. I believe the only difference between this and the Atari endorsed standard is the absence of the IO vector. So, Gemini would appear to be using the Atari supported scheme.

The IO vector was only needed by the MWC isatty() function. Several other functions have been posted that perform this operation more efficiently, so you can probably scrap it.

> along the lines of the Mark Williams spec, since i am assuming that
> MUCH more software can understand the latter, although the former is now
> the de-facto Atari supported standard. So which would be better to
> implement??
>

The Atari standard has inherent problems with any old software expecting the length byte in the basepage to be valid. Programming languages like Pascal or Modula might use it since their string format is exactly what Atari once documented as the format of the arguments in the basepage (one length byte plus the text of the string). You will get strange effects when a program gets the wrong value here.

You can observe the effect for example if you use the ff3 (file-finder) program posted some month ago in comp.binaries.atari.st with the Atari-standard (in the recently posted Master-demo for instance you can try out the Atari standard with "xargs 10" {== 8 + 2 for length byte 127 + MWC arguments and handle 2 is console}). The display is at least very strange and almost unreadable (The file finder was compiled with Pascal!).

> if the Mark Williams spec is the better one to implement, then what exactly
> is their spec. I know it's similar, but i need details ...
>

The MWC standard uses a valid length byte and the value of the ARGV environment variable has a special meaning. It is interpreted as "i/o-vector". For any handle (from 0 to 20) the corresponding position in the i/o-vector is
A if the handle points to AUX:,
C if the handle is for CON:,
F if the handle points to an open file,
P if the handle refers to PRN: and
? if the type is unknown or no file is opened with this handle.
The rest of the environment after ARGV=i/o-vector is a NUL-seperated list of the arguments passed to the program. I think the MWC-tools also pass 127 as length of the commandline (like the Atari specs say). So the only differences between MWC and Atari is the meaning of the value of ARGV (i/o-vector vs. no meaning) and possibly the passing of an invalid length byte (127) to validate the arguments.

Because of the problems mentioned above, you should at least give the user the
opportunity to switch off the extended argument passing when using old progs
expecting a valid length byte (and not checking wether it's reasonable).

3790. Phantom Typist captured in Analyzer

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 18:16:07 UTC
From: goldstein@carafe.enet.dec.com
Message-ID: <10625@shlump.nac.dec.com>
Source record: 241410

The notorious Phantom Typist has been especially mean to us lately, so I set out to get some more info on it. I am posting this with the hope that somebody in Atari, and/or some other knowledgeable person, can make use of it.

It struck last night right after bringing up Word Perfect (latest version, I think Aug. 89). This was unusually early; the previous night it wiped out quite a bit of work, but this time my wife was typing the first line at the end of the file which she had just read in. The last three letters typed began to repeat across the screen:
Deprecrecrecrecrecrecreccrecrecrec

then three bombs!

BTW, I'm using TOS 1.0, and I think the problem has gotten worse since I _stopped_ using QuickST V1.2! (I think I'll go back to QuickST, now that I know it's not to blame.) I reset and put in the Compute's Atari ST disk, Vol 1 No. 1 from 1986 (STart's competitor, now defunct) which has a tiny program called ANALYZER on it. That prints on screen the crash dump registers. Here's what I got:

Last Sys Vector: 02 Bus Error [Note: I got 3 bombs, not 2]

d0 00017DEE A0 00FECF32
D1 000001FE A1 00FEFE0C
D2 FFFE7EA8 A2 00000004
D3 0 A3 0
D4 0 A4 0
D5 0 A5 00019814
D6 0 A6 7ADA
D7 00006EEE A7 00007AB6

Flags: -0 Xs Vc Cc

Stacks: User 26000001 Supervisor 00007AB6

00007AB6 983E2300
00007ABA 00FECF46
00007ABE 0
00007AC2 0
00007AC6 0000A6F4
00007ACA 0000FFFF
00007ACE FFFF0000
00007AD2 0000FFFF

I'm not a programmer, so I can't interpret these myself! I am posting them in the hope that somebody on the net, and possibly somebody in a

position to fix the problem, can make use of them. BTW, the mouse is
fine; this is very obviously a software problem. Thanks.

I think maybe it does want you to access the new chips directly. At
least the info published in ST World (the UK one) just included a list
of registers, their addresses and what they do.

If Matthew Lodge still reads this newsgroup perhaps he could post it
here.

BTW, this may be a really stupid question but does the output from the
sample-player hardware and volume thingy get shoved down the
monitor/telly lead too or does it just come out the stereo jacks??

--Mark.

PS. I think there is an extra Xbios call in 1.4 and 1.6 (could be wrong
though)

I really hate to beg, but since the net is my only good source of info on Atari related subjects, (there is no dealer within 100 miles, and the local bookstores don't even carry the ST magazines) could some of you PLEASE! provide answers (even if the answers are that there is none/its impossible/I'm crazy for even thinking about it) to any of my questions? This is my third posting of this, with only one response so far, and I'm really getting desperate! Email to me OR to the net, as I have discovered from the 'if you find it, let me know too' responses I have gotten that there is some general interest in answers to the following questions.

1) Is there any software for the ST that can convert DEGAS, NEO, CAD-3d, or ANY of the ST picture formats into HPGL and/or DXF files OR HPGL and DXF to an ST format?

2) Can someone recommend a good X-Y type plotter for the ST? Preferably capable of color and able to handle HPGL files? Addresses and/or telephone numbers in North America would be appreciated.

3) Has anyone been able to successfully install the Hewlett-Packard version of MS-DOS on a hard disk so that you can boot from it with the software version of PC-DITTO? Does anyone know a phone number for Avant-Garde that is not always busy or a recording? Does anyone have a GT-1000 5.25" drive that WORKS with their ST?

ignac@electro.UUCP (Ignac Kolenko) writes:

>[Does Fattrib() OFFICIALLY support attribute bits for subdirectories?]

No.

They may work, but it's an accident, and not to be relied on. In future,
maybe, but not now.

In general, GEMDOS doesn't stop you from doing strange and illegal
things. I added the check for Fattrib on a directory. Previously, as
I recall, you could change directories into files, but not back. GEMDOS
does NOT keep you from shooting yourself in the foot. That's what
complex user interfaces are for.

3799. POOLFIX4: my reactions

Newsgroup: comp.sys.atari.st
Date: 1990-04-25 20:24:52 UTC
From: apratt@atari.UUCP
Message-ID: <2176@atari.UUCP>
Source record: 241371

Chris Evelo of the University of Limburg in The Netherlands wrote me to ask if I objected to Claus Brod's naming of his patched POOLFIX program. I would like to take this opportunity to make my feelings on the subject known publicly:

Yes, I object to Mr. Brod's naming of the patch. There is a world of difference between something released by Atari and something patched by a hacker and loosed on the world. The confusion caused by his choice of names is inexcusable. Not only did he add a little functionality (the XBRA fix), he also claims to have "improved" the code. That is unconscionable. Certainly there could be room for improvement: the code is the output of the Alcyon C compiler, after all. I put greater value on getting it right than on getting it small. But would YOU trust his "improvements"? I wouldn't. In general, it's possible to make semantically equivalent transformations on assembly code, but "hand-optimizing" the code can also introduce bugs.

My moral (and corporate and legal!) position on this is not reduced by the fact that I released two non-working versions of this patch before I got it right. POOLFIX4 is a derivative work from an Atari program, and that program was NOT placed in the public domain. In the future, I will be more diligent in putting copyright messages on programs like this.

To have hacked POOLFIX is not especially irresponsible; to have added XBRA so it would work with his code might even be useful; to have named it as he did, however, is unpardonable.

>listen to the AES's messages about where to put things)

Are you saying that you are doing the actual blit in your code, or just
using Line A to do it? I am sure that Atari's blit code cannot even blit
the characters to the screen at 19.2 Kbaud; I don't even think they
keep up at 9600 baud, with scrolling. I am talking about sustained
receiving at the full baud rate. I think if your accessory must spend
any time in some other app. (at 19.2 K baud) then by definition you
cannot keep up, unless you "skip" scrolls once in a while or something
because you cannot even draw the characters and scroll the screen that
fast on the ST.

Would you be willing to show me this code? Does it do any terminal
emulation within the window (moving the cursor around), or just raw
text output? Would it run an any monitor, including the Moniterm?

I have a short (40 lines, with comments?) script called rnget that
was posted a couple years ago. It's designed to automate the unpacking of
shar files. It's very nice, leaving everything up to the "cut" line
in a file named "READ_ME" and some other slick features. (Reads from,
stdin, accepts an optional argument for the pathname to store the
extracted files.

I currently have a 20 line script that we run on terminator to archive
the comp.sources & binaries postings. RIght now I'm using the C-shell,
but I will probably rewrite it in awk sometime in the near future. For the
moment all it does is put the pieces in the proper subdirectory and update
the index; the next step is to scan the Keywords field and decode/repack
collections. It's all pretty simple.

Meanwhile, it's fairly simple to select a string of articles with the same
subject using rn, and invoke a command for each article...

From: austin@cs.odu.edu
Message-ID: <12330@xanth.cs.odu.edu>
Source record: 241379

I'm looking for an ST program that will allow me to make backup copies of some commercial, copy-protected disk that I have. I don't like using the originals and have had one go bad on me already, making me have to wait six weeks for the company to mail a replacement. I've checked the atari archives and can't seem to find one; I have a feeling they've been kind of shunned around here due to the possibility of pirating. If anyone knows any commercial titles or can send me a public domain program, it would be much appreciated.

>BUT, *2.prg, which should find programs inding in 2, like pcditto2.prg,
>list none of these; but does list pc_d.2 !
>
>Now that is a feature!
>
I don't know for sure, but I would assume that the wildcards in
TOS 1.4 were designed to work like those in MSDOS. If that's the
case, then everything you mentioned is a feature. When using the
'*' as a wildcard, it means fill the rest of this portion of the
file name with '?'. The file name consists of two portions,
the name, and the extension. So:
P*.PRG really means P???????.PRG
*2.PRG really means ????????.2

You can only use one '*' in each portion of the file name
because it means fill the rest of this portion with '?'.
A '?' means to accept any character as a match. So:
?2*.PRG would match A2.PRG and A2A1.PRG, but not A1A2.PRG
BA?IC.* would match BASIC.PRG and BA1IC.TXT, but not VASIC.PRG.

Your example of *2.PRG sits on the dividing line. On the one
hand you have the '*' which says to fill this portion of the
file name with '?', but you also have the '2' on the left
side of the period, which is meaningless, since the '*' has
already filled out this portion of the file name. So, either
the '2' should be ignored, or it should be used as the match
for the extension portion of the file name. TOS 1.4 chose the
latter method.

3808. Drop-down menus in a window, and other stuff.

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 07:06:47 UTC
From: mrose@libserv1.ic.sunysb.edu
Message-ID: <8246@sbcs.sunysb.edu>
Source record: 241383

Does anyone have any ideas as to how to make drop-down menus in
a window, like in the clipboard.acc that comes with Gemini?
Is it legal? Also, how did they manage to make movable Dialog Boxes?

Also, I was thinking of purchasing STalker and STeno. Does the current
version of STalker fully support VT100 emulation and keep up with
19.2Kb? Will it work with the Overscan mod? Does anyone know
if Revolver will switch between partitions with overscan activated,
or between Mono and Color on a Multisync? Thanks alot!

3809. yet another little bug in TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 08:36:27 UTC
From: t19@nikhefh.nikhef.nl
Message-ID: <837@nikhefh.nikhef.nl>
Source record: 241385

The GEMDOS cache does not seem to know whether a drive is mounted or not:

```
# create a 100 K ramdisk on g:
$ ramdisk -c g 100
$ touch g:/aap
$ ls -altFv g:/
g:/
a----w 0 Apr-26-1990 10:32:06 aap
Total 0 bytes in 1 files
# destroy the ramdisk.
$ ramdisk -d g
$ df g
g: drive not mounted
# but .....
$ ls -altFv g:/
g:/
a----w 0 Apr-26-1990 10:32:06 aap
Total 0 bytes in 1 files
```

(though there is nothing much one can do with this file...)

3810. Need ASSIGN.SYS for Opus 2.2

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 12:22:00 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000063@ux1.cso.uiuc.edu>
Source record: 241393

I know this has been asked a million times, but I can't get
OPUS to use my GDOS- I keep getting the 'Screen & Printer fonts
do not match' alert. I have run assigner and fontwid. Is there
something I need to know about 01 02 and 03 fields in assign.sys?

I tried 01 with 04's fonts and with none and it still won't work.
If someone could e-mail their opus.sys or assign.sys I would
really appreciate it.

Thanks.

3812. Digitalk on Atari 800 family

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 15:03:16 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1673@lzsc.ATT.COM>
Source record: 241428
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I've taken the liberty to cross-post to atari.st, as that is where
old time 800 users may be.

I had a speach unit that plugged into the Atari BUS called, I think,
Digi-talk. It expanded spelled words into speech. It also had a
phoneme list, sounds that particular codes make. I gave all this away
many years ago.

I recently bought a similar unit (probably the same chip) for a PC.
No documentation.

Is there someone out there that has this beast still that would consider
sending me a copy of the manual dealing with the sound and phonemes?

Thanks

If you only have one drive, I'd go with ProCopy. It's a good
program, and ProCo Products is very good about releasing updates to
deal with changing protection techniques. I don't have their
latest version, 1.8, so I can't comment on it. 1.61 copies a lot
of stuff (unfortunately it wouldn't do DM, though I understand the new version
will...my CSB master has crashed and I don't have a backup 'cause 1.61
wouldn't handle it!)

If you have two floppies and you can handle easy hardware products, you
might want to try the Blitz copier...it involves building a special
cable, and then running some software. It's s'posed to be fast as
hell and it'll backup just about everything (or so I've heard).
Coincidentally, the doc files are available from the anonymous FTP site
at xanth.cs.odu.edu!

>If you have a file with a given name somewhere on your disk and you create a
>directory with the same name at the same path location, this Dcreate call
>completes SUCCESSFUL !

This error does not occur on my TOS 1.4 (official german) when using the
GEMDOS calls.
Dcreate returns the correct error number in this case.
Do you use the GEMDOS calls directly or through an cli? In the latter case
the cli may cause the errorneous behaviour.

> I'm going to patch this bug by telling GEMDOS to do the check itself. To
>realize this, I have to write some reentrant GEMDOS code.

GEMDOS has not to be reentrant for such a patch (if the patch is really
necessary for you). If you catch Trap 1 and wait there for Dcreate, you
can directly call GEMDOS for Fsfirst and then for Dcreate since your trap
handler is called before GEMDOS is entered.
Either you use the normal Trap 1 for Fsfirst and lock your trap handler
against recursiv invocation, or you simulate a trap (push SR and return
address onto the stack).

My view (and why not?):

I'd like to see a comp.sys.atari.st.tech, but not yet. I don't think there
are enough postings at this time for this newsgroup to be classed as cluttered.
I'd like to think, though, that such a newsgroup may somehow give rise to more
.tech postings. That would be nice. Maybe next year.

Dave.

Not quite: is the byte following "ARGV=" a null, or the first byte of argv[0]? If it's a null, they're right (and have no iovector). If it's the first byte of argv[0] it's wrong. By our specification, the information between ARGV= and the next null byte is ignored (MWC uses it as the iovector), and what comes after that first null byte is argv[0].

Message-ID: <2178@atari.UUCP>
Source record: 241415

J.Derrick@newcastle.ac.uk says he disassembled the ROMs and found some things out. Here's my reply:

I don't think it's wise to publish what you learned from the ROMs. Atari *has* "published" far more information than you could learn from TOS (since TOS doesn't use the joysticks, for instance), and you might have "learned" some things that aren't so, or aren't guaranteed to remain so. People who relied on your findings wouldn't be happy when something changed. Furthermore, as you mentioned, there are things you couldn't figure out. That just shows the inherent weakness of this kind of analysis.

If you want to know all about developing software for the STe, you can become an Atari developer and get the real information from Atari. There's a whole STe Developer's Addendum, and a TOS 1.6 Release Notes document, and more. There's example code for using the hardware screen scrolling, the light gun, and paddles (analog joysticks), and detailed explanations of all the new hardware, registers, etc.

Since we're not in this for our health, we do charge for the documentation and support you get as a developer, but we think that it's worth it: we have a new commitment to supporting developers at a higher level than in the past. (The February newsletter included a re-issue of almost the entire developer's kit, just so everybody would be up-to-date.)

If it sounds like I'm trying to sell something, well, I am. Better that people should get straight information from the source, rather than trying to reverse-engineer the guts of the machine from outside. That kind of practice results in incompatible code and upgrade headaches.

3824. STE controller info.

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 19:50:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9004280051.AA27887@ucbvax.Berkeley.EDU>
Source record: 241416

Dear STErs,

Apologies for the wait for this information, but here (at last) is the info. on the new controllers attached to the STE.

--------------------------------- cut here ------------------------------

STE CONTROLLER PORTS

Address Usage Description
==
FF9200 xxxx xxxx xxxx 3210 Fire buttons
FF9202 UDLR UDLR UDLR UDLR Joystick directions
Joy3 Joy2 Joy1 Joy0

FF9210 xxxx xxxx NNNN NNNN Paddle 0 X
FF9212 xxxx xxxx NNNN NNNN Paddle 0 Y
FF9214 xxxx xxxx NNNN NNNN Paddle 1 X
FF9216 xxxx xxxx NNNN NNNN Paddle 1 Y

FF9220 xxxx xxNN NNNN NNNN Light pen/gun X
FF9222 xxxx xxNN NNNN NNNN Light pen/gun Y

Four new joystick ports were added, directly interfaced to the 68000 bus, rather than using another IKBD controller. The table above gives the locations of the hardware registers for the joysticks, paddles and light gun/pen inputs. Note that the joystick registers are bidirectional, and can therefore be written as well as read. If the registers are written, then the outputs are driven until the registers are read again.

Two paddle controllers can be connected with eight bit resolution on each axis, and the current position of each of the four paddles are reported in the registers shown in the table. No information is given in the data sheets as to the voltage range that the A/D converters function in, but I would guess that it is 0-5V. The triggers on the paddles are bits zero and one of $FF9202 (Joystick 0 left and right.)

The light gun/pen position is reported in $FF9220 and $FF9222. The x-axis accuracy is four pixels in low resolution, eight pixels in medium res., and sixteen pixels in high resolution. The y-axis position is accurate to within one pixel in all modes. The x position only ranges from 0 to 319, and therefore must be left shifted for other screen modes. Again, no electrical information is provided on how to implement a light gun/pen.

3825. ST Penpals list (Sixth posting! :-)

Newsgroup: comp.sys.atari.st
Date: 1990-04-26 22:55:48 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9004271418.AA17817@ucbvax.Berkeley.EDU>
Source record: 241417

To *ALL* Atari ST owners worldwide!

Are you interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not got network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime).

So far this list has generated a very reasonable level of interest from many countries around the world (both in the USA and Europe!). This is encouraging and so I have merged the two lists into one and now the list that many of you will be receiving will be totally global.

Remember: it is not too late, join now and beat the christmas rush! :-) Joining the list does not commit you to anything, you do not have to communicate with anyone if you do not want to! There is no pressure, I will not sell the list to any organisations!

Regards,

Simon

I do have the developers documentation and it has errors on top of
errors. The MWC manual is a much better source of information since
it seems to have fewer errors. This alone is reason enough for me to
never buy another Atari computer.

>
[Description deleted]

I went through your procedure as described, and everything worked as
it was supposed to--Flash found its several info files and RSC file,
and dcformat found its RSC file.

Unless you mean double-click on a program in the non-selected window
with the right button down, in which case of COURSE won't work,
because you're TELLING the ST to leave the other window as the
current directory.

Click on the window w/o the right button to select it, then run the
program--it should work, unless Flash and dcformat find their
resources in a different manner than usual. Actually, Flash is
QUITE picky about such things as being opened in its own directory.

>BUT, *2.prg, which should find programs inding in 2, like pcditto2.prg,
>list none of these; but does list pc_d.2 !

I believe that the asterisk wild card character is defined as
follows: It will match zero or more characters from the current
point in the file name to the dot or the end of the name.

Under this definition, *2.prg is not a legal use of the wildcard.

Nor is p*d*.prg. Nor would be *.*p .

Not that I think this is a GOOD thing, mind you; I just object to
it being called a "bug". If anything, it's an unfriendly design,
and it isn't explained in enough detail. But, then again, a lot of
MSDOS things, and for that matter, ST things, fit that
description...

No arguments with that paragraph. I feel that things have been going
very well along these lines, for the past 4-5 months. Support looks
real, and it looks like lots of new activity is going on. It's been
worthwhile to me, just to keep informed if nothing else.

>If it sounds like I'm trying to sell something, well, I am. Better
>that people should get straight information from the source, rather

Still, all is not as wonderful as it might be. It still seems to me that
the best way to get more people writing code for the ST is to provide more
internals info, without the non-disclosure. Things like the Pexec cookbook,
or the Hitchhikers Guide to the BIOS, for example. These seem to be pretty
basic docs necessary to anyone trying to write applications for the machine.
They seem to be the sort of thing that should be available to the general
public. (And are, sort of, via various 3rd party docs...) When I went
and registered, I was expecting to be made privy to the real deep innards
of TOS - source code to GEMDOS, etc. For me being a code hacker doesn't just
mean writing my own code, but poring thru existing code to see how someone
else does something clever. ("Steal from the best" ...) I was aiming at
getting enough info to gain a deep understanding of how the OS works, not
an overview of how to use the OS.

This may become a moot point if the TT takes over and Atari phases in Unix
in favor of TOS. But if TOS is really gonna stick around for a while, it
would seem that it can only benefit from having *more* people know how it
works. And for Atari to actively support the enlightenment of interested
parties in this regard. Look at Unix, f'r'instance. Distributed with full
source code, and the Berkeley version even has a "sendbug" command that
automatically mails a bug report to the CSRG at Berkeley. 4 people put
together the 4.3 release. Surely a similar scheme for TOS development would
be manageable?

3832. BUG in Turbo C V1.0

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 07:11:34 UTC
From: joep@tnosoes.UUCP
Message-ID: <1099@tnosoes.UUCP>
Source record: 241422

While trying to 'port' the sunclock from John Walker to the ST (you know the map of the Earth, showing the portion illuminated by the Sun) I came across a very irritating bug in Turbo C V1.0. Maybe somebody can check if the bug is fixed in V2.0.

```
void wrong()
{
double e, delta;

e = 10;
delta = e - cos(e);
e -= delta / (1 - cos(e)); <----------
printf("wrong e: %lf\n", e);
}

void good()
{
double e, delta, cs;

e = 10;
delta = e - cos(e);
cs = 1 - cos(e); <----------
e -= delta / cs; <----------
printf("good e: %lf\n", e);
}

void main()
{
printf("cos: %lf\n", cos(10));
wrong();
good();
}
```

```
RESULT
cos: -0.839072
wrong e: 9.000000
good e: 4.106226
```

The bug is 'solved' by using an extra variable. Maybe I go read some 68000, but the clock works and I am satisfied. I'll post the clock within some days.

Joep,

> included a re-issue of almost the entire developer's kit, just
> so everybody would be up-to-date.)

(rest of message omitted)

A month ago I would have been up in arms about this. I would have said something along the lines of, "Allan, you forgot to check where the original message came from. Atari UK doesn't treat developers nearly as well as Atari USA now does, etc. They certainly haven't reissued the entire developers' kit."

However, there seems to have been a new start on developer support here recently. A co-ordinator (Alistair Bodin) has been appointed, and he's certainly willing to be helpful.

The only troubles are a) developers who want to reregister under the new ProSupport scheme have to sign a badly-worded nondisclosure agreement, and b) becoming a UK developer is a lot more expensive than it is in the USA. The last I heard, it cost over 300 pounds, which is getting on for $500. If ProSupport lives up to its promise, it may be worth it, but on past performance it's a bad investment for an individual or even a small company. No wonder UK users want to get information another way.

3835. An Apology to Word Perfect

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 11:14:02 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <879@ncs.dnd.ca>
Source record: 241320

A short time ago I posted a message part of which was critical of Word Perfect, describing it as exceptionally buggy. That opinion was based on demo-ing it from a software rental outlet about a year ago. I took it back after my two days of frustration and haven't tried it or any version since. I do use WP both on MSDOS machines and on a VAX with satisfaction.

At any rate, several people have 'advised :-)' me that the bugs are out and Word Perfect is now a solid and capable performer on the Atari. I have no reason to doubt that so this is to apologize both to WP and to any readers that I misinformed.

Now if only the price were to come down a little...

Bob

3836. Reg. Exp. Parser

David Dawkins asks:

> Can anyone tell me where I can find a PD regular expression
> parser ? I have heard rumour that something called 'regex' is floating
> about somewhere, but I can't find it at any archive site.

I suspect that the regex code you have heard of is the regular expression matching code from GNU EMACS. This has been written as a general subroutine, and is useful for including in anything. It's not PD, but is freely available for non-profit making use. I can send you a copy if you don't have access to the GNU EMACS code there.

Message-ID: <15314.9004271141@cxa.daresbury.ac.uk>
Source record: 241426

Steve,
I have no idea why Atari UK are so slow to make the TOS 1.4 ROMS
available, especially as they are in production... A friend who works in a
computer shop says that new STFMs are being supplied with TOS 1.4 installed.

As for using US ROMS, there are a few problems:

1) They set the colour screen parameters for 60Hz monitors, not 50Hz

2) The keyboard mapping is different - pound/hash etc.

3) The date format is different - mm/dd/yy, not dd/mm/yy

I have a set of US ROMS (from Canada actually), and have blown new ROMS to fix
(1) and (2) - I can tell you what I changed if you wish. What other problems
may be lurking I have yet to discover.

3838. Mac Emulators on ST

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 12:10:09 UTC
From: v128ll9e@ubvmsd.cc.buffalo.edu
Message-ID: <23266@eerie.acsu.Buffalo.EDU>
Source record: 241324

I own an Amiga with Amax, but Amax is usally run in interlace (flicker mode) and this is unviable. I know very little about ST's, no flames on my ignorace please!

I have a friend who needs a Mac, or at least an emulator. He needs a full screen (does the ST have hires?), no flicker (does ST have interlace?), and almost 100% compatibility. Colors are not a concern but memory is. How many megs can you go up to?

In short, what emulator is the best? Spectre? I have also heard rumors(?) that there is a Mac emulator avalible for the ST that is able to read Mac disks directly from the ST's internal drive.

Your help is greatly appreciated. Please respond via Email

-Rich

P.S. Let me update that, just Please respond.

3840. Phantom Typist and Atari's Responsibility

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 12:59:52 UTC
From: wkk@cbnewsl.ATT.COM
Message-ID: <5400@cbnewsl.ATT.COM>
Source record: 241336

Well,
People say "What's the big deal, this ain't Atari Corps. fault!",
but that is not really the point. This problem has been seen by many people
around the World. If the problem is Atari's fault, for example in the
keyboard processor or associated software then it is clearly in Atari's
interest to determine what the problem is and either fix it or provide
a work-around. Also, if the problem is with application code, for example
WordPerfect, First Word+, etc., then it is STILL in Atari's interest to
determine why THEIR machine is being used incorrectly and to identify
the correct procedure for these companies to fix the problem.

Sice I have seen the problem occur in radically different software I find
it hard to believe that all of the application writters have inadvertantly
used the exact incorrect technique to handle the keyboard. Also, it is hard
to beleive that all of the programs fail to return vectors back to TOS.

Why does tapping the mouse help speed characters to the screen? If I tap
the mouse, moving it only by a few pixels and not moving it out of a
region, characters that were typed and not displayed start showing up!
Come on now, somebody must take action. Also, if the problem is in the
keyboard processor, then breakpointing in the application program or test
program may not work, since the interaction with the debugger will probably
be affected as well.

3841. STSWITCH... How to get it...

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 13:06:21 UTC
From: dac@ukc.ac.uk
Message-ID: <2953@gos.ukc.ac.uk>
Source record: 241327

A few people have asked me how to get STSWITCH. I tried to reply by mail but your addresses got bounced back. Sorry.

Anyway, you can get STSWITCH from the Lancaster PD Archive in England.

Send mail to:

archive-server@pdsoft.lancs.ac.uk

With the line:

send micros/atari/m235/m235switch.uue

in the message body.

Lancaster do IBM, Amiga, ST and Mac software (at least). You can get indexes by doing:

send index

or

send micros/index

or

send micros/index/atari (or mac, amiga, ibm).

Things get more specific as you go along.

Enjoy...

Dave.

From: joep@tnosoes.UUCP
Message-ID: <1100@tnosoes.UUCP>
Source record: 241337

I found the bug in the disassembled file. I won't list it here, but
this is what happens.

```
> void wrong()
> {
> double e, delta;

> e = 10;
> delta = e - cos(e);
> e -= delta / (1 - cos(e)); <----------
> printf("wrong e: %lf\n", e);
> }
```

The result of the calculation (1 - cos(e)) is placed in memory on
lets say address ADDR. After that calculation 'delta' is copied
to the same location, so not

```
e -= delta / (1 - cos(e));
```

but

```
e -= delta / delta;
```

is calculated, which gives '9.0000' as result.

I don't understand why delta is copied before this calculation!

Joep,

```

Get Procopy v 1.7. Just came out this year. You might want to call and
check to make sure it can back up everything you have. Address is:

Proco Producs
P.O. Box 665
Chepachet, RI 02814

(401) 568-8459

No single ST copy program can back up everything. Some of the newer ones
that can copy the newer software fails on things that a PREVIOUS version
of the SAME program did work on. This was true in the recent past, perhaps
it has changed. I have three different versions of Procopy that can
collectively copy all of my stuff (strange, very strange).

I had the same type of problem with my ST mouse. I fixed mine by opening up the dude and glueing a doubled-over piece of paper on the end of the post for the mouse button. In closer view, the post actually caused an indentation in the switch thereby causing a loss of sensitivity. Anyway, the piece of paper caused the ol' mouse to work good as new.

Hope this helps!!!

3853. Fading SM124 inverse video

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 15:25:49 UTC
From: idh@NABLA.ELECTRICAL-ENGINEERING.UMIST.AC.UK
Message-ID: <9004271625.a015851@nabla.electrical-engineering.umist.ac.uk>
Source record: 241432

When I use my SM124 monitor with inverse video (white on black)
I find that the characters become increasingly dim, eventually
becoming illegible; most especially when the screen is almost
entirely black already. Has anyone else found this/got a
solution ?.
(Apart from avoiding inverse video !)

3854. OS9/68K

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 15:35:20 UTC
From: D.Wade@sysd.salford.ac.UK
Message-ID: <27.Apr.90.16
Source record: 241433

I too would like to try OS9/68K but in the U.K. the cost of it is slightly more than I paid for my STE512 and Phillips PM8833 monitor ..... Whilst this is fine for commercial use there are many other things higher on my personall shopping list. I guess those who use it either work for the authors and don't pay, or use it for commercial use.

Sorry no signature file but replies outside the UK may be sent to:- D.WADE@D.SALF.AC.UK - Most Places, MS2@UKACRL - Bitnet.

That's easy. Ataris specification ist THE standard, so PLEASE use it.
Other shells (Gemini 1.1, Master) do it, too!

3856. Help with ST4038 and Omti MFM controller

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 16:00:20 UTC
From: pbh@pandora.cs.wayne.edu
Message-ID: <1180@wsu-cs>
Source record: 241435

I have just purchased a Seagate ST4038 30M hard drive and I'm trying
to get it formatted with my ICD software. I enter two DOS partitions
(12, 4) and two Minix partitions (1, 13). I get past the screen
for entering bad sectors, tell it to "go", and it spins the diskette
and tells me it can't find the file omti.fmt - which I can find on
the original disk and the backup I made. Anybody have any suggestions?

>megs can you go up to?

The standard Mac screen is 500x350 monochrome. The ST monochrome is 640x400.
The ST monochrome screen is rock steady, no flickers, with a 70hz video
refresh rate. The Spectre GCR is almost 100% compatible. It eats about 130K
of your available RAM in support code. You can have up to 4M of RAM installed.

>In short, what emulator is the best? Spectre? I have also heard rumors(?) that
>there is a Mac emulator avalible for the ST that is able to read Mac disks
>directly from the ST's internal drive.

Spectre GCR lets you use Mac floppies directly. Spectre (no GCR) is the older
version, that requires a hardware translator to use Mac disks.

Source record: 241438

wkk@cbnewsl.ATT.COM (wesley.k.kaplow) writes:

>Why does tapping the mouse help speed characters to the screen? If I tap

The mouse, joysticks and keyboard are all connected to the intelligent keyboard processor (IKBD), which talks to the 68000 via a serial port, sending packets which represent keypresses, mouse movements and joystick switch state changes. There is a chunk of code in the atari ROMs which reads and interprets these packets. When the character slowdown occurs, the interaction between the IKBD and the keyboard handler code is broken. Tapping the mouse somehow forces a packet to get through, or breaks the deadlock in some other way. You would probably have to look at both the IKBD code and the keyboard handler code to see how that protocol works.

>Sice I have seen the problem occur in radically different software I find
>it hard to believe that all of the application writters have inadvertantly
>used the exact incorrect technique to handle the keyboard. Also, it is hard
>to beleive that all of the programs fail to return vectors back to TOS.

I don't think that ANY of the applications fail to return borrowed vectors. Whenever I forget to return a vector to TOS the result is a pretty prompt crash after exiting my program. What I suspect is happening is that the applications do one of the following:

1. Use their own keyboard handler vector which 'breaks' the IKBD/68000 protocol
OR
2. The application is spending too much time in a non-interruptable state which cause the IKBD/68000 protocol to break down

>Come on now, somebody must take action. Also, if the problem is in the
>keyboard processor, then breakpointing in the application program or test
>program may not work, since the interaction with the debugger will probably
>be affected as well.

This is very true - this type of beastie is almost impossible to trap on its own turf - by the time you know something is wrong, the event causing the problem is ancient history - which is why I recommend:

1. Find a way to tweak the application to make the problem occur more frequently

2. Isolate the factors which control the frequency of problem occurence as much as possible and build a test porgram which has just these features

3. Use the test program to isolate even more what is causing the problem
You will often find that there is a single causative factor, without

which the problem would never occur, and other factors that
to the problem

Example: (This is not a prediction!)
Causative factor:
Cursor handling (graphics) is all being done inside a
non-interruptible routine (restore pixels under old cursor
position, save pixels under new cursor position, draw cursor)
Contributing factors:
A) Keyboard handler/IKBD protocol assumes keyboard handler will keep
up with characters coming from the IKBD (no RTS/CTS flow control)
B) Keyboard handler/IKBD protocol does not have an error detection
or protocol recovery mechanism
C) Application does redundant cursor operations

4. Modify the original application code based on what you learned in the
previous steps, eliminating any causative factors and improving
contributing factors where possible

5. Prove that your fix eliminates the problem, or at least makes the problem
irreproducible under the worst conditions you can create.

The application suppliers have the responsibility to their customers to at
least do the analysis of the problem, and if they find that the problem can't
be fixed on their end, they should work with Atari to eliminate the problem.
That is part of what Atari developer support is about. The application
supplier took your money and they should provide you with some service other
than a ticking bomb application.

The basenote said something about how Atari wasn't in the developer support (HA!) area for their health and that anyone wanting detailed (HA!) information should become a registered developer. Doesn't it stand to reason that Atari could benefit far more by providing copious amounts of information about TOS at a reasonable price to a larger audience rather than releasing an expensive box of outdated photocopies? It seems to me that the ultimate success of a machine has a lot more to do with the number of people and quality of people writing software for it. What sense does it make to rape a few thousand people for developer docs when you could sell them more cheaply and get more people to write programs for your machine. Without software, the machine will die and the $10-20,000 you earned on selling those photocopies will not mean much anymore.

>
> Thanks much!

The way you update each window is completely up to your
application. You need to somehow store the data that is in each
window and be able to redraw the entirety of each window at any time.
Basically, GEM sends back a list of rectangles that need to be
redrawn, and you need to find which of your windows those rectangles
overlap and redraw the overlaped section. One easy way to do this is
to find the overlap section for a window, set the clipping rectangle
to this area, and then redraw the entire window. Do this for each
rectangle GEM sends you for each window you have open. The window
bars and the background are redrawn automatically.

> the designer's notes, or the tools for repairing or improving it. That
> price point is for users, not necessarily programmers.
>

I can't help but disagree with this. A car and a computer are very
different types of things. One buys a car (in general) for the
purpose of driving it. While one may buy a computer simply to "drive
it" by using existing software, many of us (especially ST users!) buy
the machines to program them. That _is_ part of the machine's use, as
evidenced by the wide variety of compilers and interpreters which are
available.

> What you get when you pay for the developer's kit is the MUCH HIGHER

> questions). I don't know, but some subsidiaries might offer that:
> documentation without support, at a lower cost.
>

This is _exactly_ what many of us want. I don't want Atari Corp. to
hold my hand; I just want enough information to be able to write a few
public domain programs. And I don't have $250 to shell out for this
information. If money wasn't a concern I might have got an IBM; there
is no end of free information about PC internals.

> Personally, I think that is dangerous, because it gives people
> "a little knowledge, and a little knowledge is a dangerous thing."
> You end up with people who ONLY know technical things, and the result
> is programs which are impolite to the system and make upgrades and
> compatibility the nightmare it is.
>

Please, you can't really expect me to take this seriously. With no knowledge of the "right" ways to do things, programmers have no choice but to do everything the "wrong" way. The only way to prevent this is to make information available. If you don't tell us how to make our programs "polite," then they are going to chew their food with their mouths open, if not spit it in your lap. To this day I still do not have documentation on the Bios and Xbios calls; all of my ST programming has been done by guessing what these calls do based on the names given to them in the OSBIND.H I got with Sozobon C. How can a program based entirely on guesswork be at all "polite" to the operating system? What would be the harm in Atari publishing a small free reference on Bios, Xbios, and GEM? This information alone would be extremely valuable.

> If you have a gripe about the level of support you get for your money,

>

Just because nobody comes to you and asks you these things doesn't mean you can't make suggestions. If you went to Mr. Tramiel and said "at least 50 people on comp.sys.atari.st have complained about the level of support offered by Atari" don't you think he would be interested?

I'd like to add that for all the griping I do here about documentation (or lack of it) I'm very pleased that Atari even bothers to have someone on the Net to discuss their equipment with us. I've found most of your postings dealing with technical issues to be extremely enlightening. I hope you'll continue to contribute in the future.

Thank you for your time,
nick

3869. Lharc 113 problems ....

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 20:26:59 UTC
From: olorin@tardis.computer-science.edinburgh.ac.uk
Message-ID: <sent.Fri.Apr.27.20
Source record: 241448

Is there a version of lharc later than 113 for the ST ? 113 has one
or two problems. Basically it will not read unix lharc files. This is rather
a nuisance as it appears that the source code was archived with unix lharc
and it thus wont extract its own source !

Analysis of the source code reveals that there are two reasons for
this. Firstly the checksum header routines assume an ST/msdos format header
(the function mksum). The msdos version of mksum is correct in this
respect however. There is a simple fix for this . Second problem is that
no / to \ translation takes place which results in some rather odd
looking filenames !

I seem to remember it being more like $80, with a xerox of one's student
ID. Offer could be over though.

3872. GULAM help wanted

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 20:51:46 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9004280705.AA19863@ucbvax.Berkeley.EDU>
Source record: 241301

I need some advice here,

I recently (about 2 weeks ago) saw on here a mention of the current Email address of the author of the Gulam shell, a Prof. P.Mateti, I cannot remember who posted it, but I would like them to confirm the address as the one that I copied from their message (carefully!) managed to reach the site named, but was returned with an unknown user error!

The address that I used (from the UK JANET network) was:
p.mateti%cs.wright.edu@uk.ac.nsfnet-relay

Everything to the right of the percent sign seems to work, because I got through to Wright State University, but the username seems to be non-existant. Now this is a real shame because the Gulam shell would be very very good value for money if I had paid for it, but I was wondering if there was a more recent version released than the beta test version that I seem to have, dated about 1987 if I remember the documentation correctly.

I am after either, or both, any more recent versions of the binaries or a copy of the source code. Any help with any of the above will be gratefully received.

Simon.

3873. ST Penpals list (7th posting)

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 20:52:48 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9004280706.AA19930@ucbvax.Berkeley.EDU>
Source record: 241302

To *ALL* Atari ST owners worldwide!

Are you interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not got network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime).

So far this list has generated a very reasonable level of interest from many countries around the world (both in the USA and Europe!). This is encouraging and so I have merged the two lists into one and now the list that many of you will be receiving will be totally global.

Remember: it is not too late, join now and beat the christmas rush! :-) Joining the list does not commit you to anything, you do not have to communicate with anyone if you do not want to! There is no pressure, I will not sell the list to any organisations!

Regards,

Simon

3874. Disassembling TOS and documentation issues

Newsgroup: comp.sys.atari.st
Date: 1990-04-27 21:14:50 UTC
From: apratt@atari.UUCP
Message-ID: <2179@atari.UUCP>
Source record: 241303

I wrote that you had to become a developer to get technical information on the STe. While that may or may not be true, some people have asked why they have to shell out more money just to write programs that take advantage of the new hardware.

What you get when you pay for the STe is the machine and the customer-level support that Atari gives. That's what the person who buys a car gets. He doesn't get the maintenance manual, the engineering drawings, the designer's notes, or the tools for repairing or improving it. That price point is for users, not necessarily programmers.

What you get when you pay for the developer's kit is the MUCH HIGHER level of support that Atari gives to people who are going to write programs that (presumably) will help sell ST's -- this is known as "enlightened self-interest." I see what you want: an intermediate step, at a lower cost, which would give you some technical information about the machine. In return for the lower cost you would give up the support we offer (which is to say, the right to ask people like me hard questions). I don't know, but some subsidiaries might offer that: documentation without support, at a lower cost.

Personally, I think that is dangerous, because it gives people "a little knowledge, and a little knowledge is a dangerous thing." You end up with people who ONLY know technical things, and the result is programs which are impolite to the system and make upgrades and compatibility the nightmare it is.

If you have a gripe about the level of support you get for your money, that's legitimate. You should complain to the president of the subsidiary you're dealing with, or to Charles Cherry, who is the Developer Coordinator for Atari headquarters. You can even write Sam Tramiel. If you do, try to be brief and specific, but not technical, about your problems, and name names. If you just write and whine you're wasting your time and his.

I don't make decisions, so those are just my personal beliefs. Nobody comes to my office, taking notes, asking, "What levels of support should we offer, and how much should we charge?" They don't do that here in the US, much less in other countries, where we have independent, wholly-owned subsidiaries. We throw machines and documentation at them, and they do what they like with them. (There is feedback the other way, of course, but that's the basic picture.)

I was looking through the atari archives at panarthea and
found what looks to be a very interesting program called Unix Windows.
If I'm reading things right, this program will allow the opening of
several windows, each containing a different process, while logged
into a UNIX system over a modem. The only problem is the program is
only the client side of the package and didn't say were the UNIX host
program might be found. Is the host side a commercial program or is
it available from an ftp site somewhere?

This has been discussed a couple of times. The gist of what I've read is that, for every version of WordPerfect, be it Atari, PC, Mac, or whatever, there is a student discount price of $99. Every dealer who sells WordPerfect should honor this price. They should have the forms WordPerfect Corp. supplies for student discounts. If they don't, well, call up WordPerfect and complain and then go someplace else.

Source record: 241308

In article <1990Apr27.185702.10436@cunixf.cc.columbia.edu> cmm1@cunixa.cc.columbia.edu (Christopher M Mauritz) writes:
-The basenote said something about how Atari wasn't in the developer
-support (HA!) area for their health and that anyone wanting
-detailed (HA!) information should become a registered developer.
-Doesn't it stand to reason that Atari could benefit far more by
-providing copious amounts of information about TOS at a reasonable
-price to a larger audience rather than releasing an expensive box
-of outdated photocopies? [more follows]

(The following refers to the atari developer program in the US; things may be different elsewhere)

From what I've been told, much of the second or third generation photocopied documentation that was originally part of the developers' kit has been rewritten and updated. I also know for a fact (since I am a registered developer and have the stuff) that many new documents have been written and distributed to _all_ registered developers. Your point may be that the documentation is not in bound book form or even binder (until the TOS 1.4 notes), and if it is, you are correct, but thinkgs aren't the same as they were as couple of years ago.

As far as support from Atari goes, it has _greatly_ improved. The newsletters have been arriving monthly since December, and documentaion and disks with tools, examples, and useful information have been packed in with them.

Finally, Atari's software engineers have regularly been posting their ideas on the ATARIDEV roundtable on GEnie to give registered developers a chance to review them and give feedback.

In my opinion, the only part of Atari that _hasn't_ changed for the better (and the changes have been remarkable) is the part that [suposedly] markets Atari products. Perhaps we'll see a change there too as products become available in the US. Supposedly new FCC-passed STEs are on their way to the United States right now. Watch for 'em!

- It seems to me that the ultimate success
-of a machine has a lot more to do with the number of people and
-quality of people writing software for it. What sense does it make
-to rape a few thousand people for developer docs when you could
-sell them more cheaply and get more people to write programs
-for your machine. Without software, the machine will die and the
-$10-20,000 you earned on selling those photocopies will not mean
-much anymore.

No argument there. I don't think Atari is trying to _make_ money on the developer kits, but partly the money is a way of attempting to weed out those who are "documentation junkies" and aren't actually trying to develop the programs to which you refer.

> This is ridiculous. There may be inherent *legalities* about
> publishing a dismantled ROM, but there is no "inherent weakness"
> in this kind of analysis. It is merely very difficult.

I think you are wrong. You can learn only so much from the ROM. You can learn what the ROM code does, and how it does it. But you can't learn things that the ROM code DOESN'T do. You won't learn the right way to interact with the DMA Sound chip (the ROM doesn't use it). You won't learn about ARGV or the functional limits of the cookie jar (that accessories can't use it).

You *will* learn things which just happen to be true, but which aren't guaranteed. You will learn that calling the BIOS with an invalid function number returns different things depending on the number. You will learn the addresses and uses of variables and data structures. It's not a secret, it's just that we need to be free to change those things in the future. If your program relies on something stupid and becomes popular, we could get stuck with a feature we don't like, a feature YOU don't like and didn't realize was outside the "rules" for well-behaved programs.

THAT'S why it's dangerous to disassemble the ROMs and take lessons from what you find.

[Flame on]

This kind of analysis is not that hard, folks. Please think a little before posting stuff. I'm not stupid. When I say something, I usually have reasoned it out a little. If you think about starting a posting by calling my arguments ridiculous, maybe it's because YOU haven't thought through the implications of what was said or my response.

[Flame off]

3881. GDOS and WORDUP 3.0

Newsgroup: comp.sys.atari.st
Date: 1990-04-28 01:03:22 UTC
From: MAXG@SUVM.BITNET
Message-ID: <9004280712.AA20157@ucbvax.Berkeley.EDU>
Source record: 241310

A while back I posted a question to the net about the possible coming of a new GDOS (something I read in Current Notes). I asked if anyone knew anything about that, because I was wondering whether or not to buy G+Plus with a new GDOS on the horizon. Well, it looks like I don't have to think about this any longer. The only program I use that makes use of GDOS is WordUp. I got my 3.0 upgrade info in the mail today and guess what? -- WordUp 3.0 doesn't use GDOS! or at least that is what I understand from the flier...here is what it says:
"Word Up bypasses GDOS and automatically loads one the printer fonts needed for printing a particular document. The screen fonts will be temporarily unloaded while printing if you are short on memory. Thus, Word Up no longer suffers from the severe memory limitations that plague other GDOS programs. We have simplified the method of adding fonts, avoiding the ASSIGN.SYS file altogether, so as font sets are released it will be practical (even for a 520ST/1040ST users) to have multitudes of fonts installed with Word Up."
Well, what do you think? Does that mean no GDOS at all with Word Up? I'm going to get the upgrade in any event (there are quite a lot of improvements, it seems)...but at least I don't have to get G+Plus as well, I guess.
---Gerry

3882. Re: Help, where can I get LINT

I know of no version of lint for the ST.

Working 1.2 binaries were posted to comp.binaries.atari.st.
They should be available from panarthea and terminator.

> I need it in sort of a hurry as I keep shooting myself in the feet and it

> compile!

Keep your modules short, or your code perfect, whichever is easier.

> Also, does anyone have any short comments on how to use MAKE? I have split
> my main program up so that it covers a number of smaller .c files, but at
> the moment I am doing the following:
>
> #include "filename.c"
>
> I realise that this is possibly not the best thing to do as I am constantly
> recompiling code that is tested and debugged, so I need help!

Eek! Simon, that's not the way to do it. No wonder your compiles are long.

cc.ttp has a -c switch that means "just compile the file, and don't link
it." If you do this:

cc -O -c file1.c

you'll wind up with file1.o in the directory, assuming it passed the tests.
Repeat the process with the other modules. When you're done, link them:

cc -o program.tos file1.o file2.o file3.o

et cetera. You can mix .c, .o and .s filenames on the command line,
plus libraries (.a files, or files with no extension).

"make" is another animal entirely. It knows how to use cc.ttp efficiently,
but it's not a very friendly program. And Sozobon's make.doc is of little
help.

Nevertheless, here is a sample makefile. I'm not a make wizard, but it
appears to work. Yes, I did test this one. :-)

```
# Generic makefile for constructing GEM applications
# with Sozobon C and GEMFAST.
# Change CFLAGS, OBJECTS and PROGRAM as needed
# and leave everything else alone.

OBJECTS=file1.o file2.o file3.o
PROGRAM=program.prg
CFLAGS=-v -O
GEMLIBS=aesfast.a vdifast.a

$(PROGRAM): $(OBJECTS)
$(CC) $(CFLAGS) -o $(PROGRAM) $(OBJECTS) $(GEMLIBS)
# (Notice how this translates when make is run.)
# end
```

The format appears to be

```
target:<tab>dependencies
<tab><tab>command line
```

Make looks for "makefile" by default; you can run "make -f altfile" and it will look for an alternate makefile "altfile" instead.

I've been trying to get things going between my Portfolio and 1040ST
but haven't been having much luck. Could anyone who has any of the
following programs please mail me a copy?

I guess it appears I'll need something like the XTERM2 package,
as well as BINHEX.COM and CHKSUM.COM. Is BINHEX in a form which
is capable of being copy directly to the portfolio thru the AUX port?

Also, I saw mention of a program called PFBOOT.ZIP which is availiable
on CIS which is suppose to make the process of getting transfers
started alot easier. Anyone know anything about this?

Thanks for any help you can give me.

I recently received a UUCP archive for the Atari ST. The program is
by John Logajan and released in the Public Domain. It is version 1.1.
The MAILTRUK file has an error and I was wondering if someone could
tell me where I can get another copy. The code is in GFA Basic 2.0.
The error is a WEND without a WHILE.

I would also like to know, if I ever get the programs to work, where I
can call to test it out. Does anyone know of any UUCP sites in the
New Jersey area? I am not too familiar with this, so any information
would be appreciated.

I believe that one can learn a lot by disassembling ROM code. I remember learning a lot form reading the TRS80 code. Of course, it does take a long time, and if you just want to write programs that work well then take Allan's advise. This is particularly important if you are going to write a program that is going to become popular. Sometimes I think Allan is a little overly concerned about the kinds of trouble we can get into by our selves, but then he often has to spend much more time dealing with some of these mistakes than we do. Cheap acturate information would be a great help.

>
>I have seen something called Art and Film Director that is pretty neat

The two primary (as far as I know) animation programs are CYBERPAINT by Antic software and ART & FILM DIRECTOR (it's a boxed set) by Epyx.

CYBERPAINT strong points: It animates by "delta animation". The computer animates by storing the changes between each frame. This is nice because small animation changes take up less RAM, meaning you can get more frames of animating in. It's also easy to use -- you draw each frame and the computer does all the processing. CYBERPAINT also has lots of built-in special effects that you can do in a sequence of frames (rotate a graphics block n degrees in 10 frames, etc.)

CYBERPAINT weak points: With delta animation, large changes (scene 1 to scene 2) take up LOTS of memory. Generally, quality Cyber animations take from 2 to 4 megabytes. CYBERPAINT does not support sound, and drawing each individual frame can be tedious.

ART & FILM DIRECTOR strong points: It animates by a computer equivalent of cel animation (Disney et al). Art is drawn on one of 16 screens. Rectangular blocks of the screens is then "clipped" for cels, which can be arranged in groups for easier manipulation. Less memory is used by A&F, and prepackaged sounds/musics can be used (30 sounds are provided, and you can select up to 10 for your animation. There is/was also an expansion disk with sample frames and sounds). Generally, you would use ART DIRECTOR to draw the screens, then FILM DIRECTOR to create your animation. Full scene changes do not take any extra memory, aside from that used to store the image itself.

ART & FILM DIRECTOR weak points: Animation can become repetitive easily, since your animation is limited to how many cels you create. Customized sounds and music is nonexistent. The animation process is more confusing than CYBERPAINT, though the manual has a quality tutorial to guide you through the tools. Epyx has gotten out of the computer software business, so this program is harder to find (The Atari ST magazines have mail-order ads, they can probably get you the A&F package for $20 [originally priced at $70, it's a steal!])

I would suggest you look at what you're trying to do, then pick the tool appropriate for the task. Personally, I find ART & FILM DIRECTOR to be more flexible to use than CYBERPAINT, but I like to generate animation similar to "traditional" animation.

In article <2167@atari.UUCP> Allan Pratt writes:
> What threw me was the original subject line, saying this bug was in
> GEMDOS 0.23 (Which is Rainbow TOS's GEMDOS). It's not there, and it's
----
> documented as a change, and the previous, undesired behavior is also
> documented.
I thought that the return value of Sversion() is to be interpreted
as:
0x1300 -> Gemdos 0.19 (TOS 1.0 and TOS 1.2)
0x1400 -> Gemdos 0.20 (this buggy french thing called Turbodos)
0x1500 -> Gemdos 0.21 (TOS 1.4 and TOS 1.6)

So the meaning is:
high byte: minor revision number
low byte: major revision number

Hello from Singapore,

I learn that the Happy Computer Inc, Maker of the Discovery Cartridge has put up the latest version of their software for the user to download on the Happy BBS. I own one of the cartridge with software version 2.7 and would like to updated mine to the latest version. However it is impossible for me to logon the US BBS from Singapore. I wrote to the Happy Computer several time but never get any reply from them.

I shall be most grateful if anyone will be kind enough to e-mail me the update file and the BETA version software which can convert the Atari 8 Bit diskette to ST format. I heard that both are in small ARC format files.

Thank in advance, Suthipuntha. School of Architecture,
National University of Singapore

From: dac@ukc.ac.uk
Message-ID: <2957@gos.ukc.ac.uk>
Source record: 241338

In article <2179@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
>What you get when you pay for the STe is the machine and the customer-
>level support that Atari gives. That's what the person who buys a car
>gets. He doesn't get the maintenance manual, the engineering drawings,
>the designer's notes, or the tools for repairing or improving it. That
>price point is for users, not necessarily programmers.
>

When you buy an ST you get ST BASIC, right? Doesn't that qualify as
a programming tool? If ST users are not meant to program their machines
and therefore become interested in doing so, why is a programming language
supplied in the box?

I believe that if someone wants to buy a machine for applications only then
they'll buy an IBM compatible. If they want DTP they'll get a Mac. Think
about it. Why should someone just interested in running applications be
interested in the underlying OS, or the processor, or the hardware support?
People I know buy STs because:
1) They're cheap ("Power without the price", who said that? :-))
2) There's a good software base
3) They're a joy to program.

Number 3 is the important one there. I know people who have bought Amigas
because of the hardware and the multi-tasking and have ended up pulling their
hair out because the OS is so complicated. Then they see me on my ST and they
wish they had one too. They have the HAM screen. They have the 4096, five
plane screens with sprites, Copper effects, smooth scrolling, fullscreen, etc.
But, do they have an OS they can program without taking a three year course
in, "Understanding GURU messages"? No. And that's why they sell their Amigas
with their games and Exec/Intuition/DOS/etc books they thought they'd be
able to understand, and buy STs.

The STe has hardware this and hardware that. Very useful for games if nothing
else. I like to play with the hardware. My own circumstances mean I still have
a good old ST with old ROMs. But, my collection of Abacus books tell me how
to use the OS, GEM and hardware. They get it wrong in places and the current
ones know nothing of the new hardware (I don't think).

I would like to see official Atari documentation at a reasonable price. What's
reasonable? No more than the cost of one Abacus book. Atari could release
they're own information on TOS and the hardware and sell it for the same price
as "ST INTERNALS". They could release information on GEM and sell it for the
same price as "GEM Programmer's Reference". People WOULD buy official Atari
documentation because they could afford it and they would know that the
information was the most accurate available.

The people who would benefit would be us, Joe Public. If you think about the number of ST owners who have net access and moan about the lack of technical information available for the ST, just think about how many ST owners who DON'T have net access but still want the information. People who write PD programs can't afford to become registered developers as they get no money from their programs. However, the quality is certainly there and it does help to sell machines.

>If you have a gripe about the level of support you get for your money,
>that's legitimate. You should complain to the president of the
>subsidiary you're dealing with, or to Charles Cherry, who is the
>Developer Coordinator for Atari headquarters. You can even write Sam
>Tramiel. If you do, try to be brief and specific, but not technical,
>about your problems, and name names. If you just write and whine
>you're wasting your time and his.

Before, you or Ken B. wrote to the net telling us all that moaning got us nowhere because it's easy to sit at a keyboard and flame, and that more good would come from writing a polite letter (yes, on paper) and sending it to the person responsible.

Well, sorry.

>I don't make decisions, so those are just my personal beliefs. Nobody
>comes to my office, taking notes, asking, "What levels of support
>should we offer, and how much should we charge?"

We know that you take time out to post to the net. Alot of Atari flames are directed personally at you and I'm sorry about that. This article is not written as a personal attack. I know that you just work for Atari and so can't walk up to Mr Tramiel and say "Listen, Sam, buddy, I'm getting a load of grief from the net. These people want information and they want it NOW." But, when we in netland see your name and address, all we see is ATARI! Like it or not YOU ARE ATARI. I bet lots of people would love to mail Mr T. and flame him if they could, but they can't. So you're it. I guess we would like to think that you whisper things you read to other people in Atari, who whisper to others, etc and in the end the information *may* get to someone who can do something about it.

Please may we have some good Atari technical documentation at a price everyone can afford. Please suggest this to someone who can make decisions of this nature.

"Power [to program] without the price".

Dave.

Well, I would suggest Current Notes. It is based in the DC area, so many of the ads are local. It is my favorite Atari magazine. They can be bought in several places in the DC area (Potomac Mill Mall has a newsstand that carries them), or you could get a subscription. Address is:

Current Notes
122 N.Johnson Rd.
Sterlning, VA 22170

One year costs $24, and consists of 10 issues. The DC area has many Atari users groups, and several really nice Atari stores. I am in no way connected with Current Notes, other than as a satisfied subscriber.

3897. Now Available: Digital Keyclick, Beep, and Digivec

Newsgroup: comp.sys.atari.st
Date: 1990-04-28 17:24:04 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr28.172404.16456@wam.umd.edu>
Source record: 241341

I've posted three new shareware utilities to terminator (35.1.33.8).
They include:

Digital Keyclick - Replace keyclick with digitized sounds
Beep - Rewrite of Dan Wilga's newbell
Digivec - Trigger digitized sounds with various
system events

Digital Keyclick allows you to map digitized sounds onto the keyboard in almost any way you want. Beep is just like newbell, except that it lets you specify playback speed in Hertz. Digivec will replace any system vector(s) with a routine to play a digitized sound. (e.g., play a sound when a bus error occurs, play a sound when a GEM critical error occurs, etc.)

This is the first release of these. I've been using them for about a month without problems, but please report any odd behavior. They don't do anything risky so they should work on all vesion of TOS.

All three are in the arcfile atari/music/samples/digistuf.arc

They'll show up in comp.binaries.atari.st soon.

Have fun,

Dave Baggett
dmb@cscwam.umd.edu

3898. MIDI Sequencers, patch librarians, etc.

Newsgroup: comp.sys.atari.st
Date: 1990-04-28 17:58:00 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Apr28.175800.13815@terminator.cc.umich.edu>
Source record: 241342

Does anyone out there know of any other PD/Shareware sequencers or patch librarians other than midiseq.arc?

If so, please mail me one, let me know of one's existence, or better yet, post it to terminator.

Thanks and have a swell day,
Jmw

3899. Sozobon C v1.2

Newsgroup: comp.sys.atari.st
Date: 1990-04-28 18:45:20 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <19620@eagle.wesleyan.edu>
Source record: 241343

I tried to download the sources for Sozobon C 1.2 from Terminator (I think it was in the directory atari/Sources/volume02/sozobon1.2) and noticed that the last part (part07) is only 512 bytes long...it seems to contain the first 20 lines or so of a text file, which ends abruptly in the middle of a sentence. Could whoever runs terminator get a correct version of Sozobon 1.2 sources installed in there? And someone said binaries for it are up on Terminator, but I can't find them anywhere. Any pointers for the clueless?

many thanks
nick

>questions). [...] documentation without support, at a lower cost.
Exactly. This is what I got from the old Atari -- _De Re Atari_ (even if
it showed up as 10 articles in BYTE before I got it), the HW Tech ref, the
OS Tech ref, and the source to the whole *ing OS. That is what I expect
from the new Atari. I only trust what compiles anyway... (or assembles)

>Personally, I think that is dangerous, because it gives people
>"a little knowledge, and a little knowledge is a dangerous thing."
>You end up with people who ONLY know technical things, and the result
>is programs which are impolite to the system and make upgrades and
>compatibility the nightmare it is.
That is one of the most patronizing things I've ever heard. Make the OS
upgrades and let the fast-and-loose folks live with their results, but
please don't bother saving me from myself.

The 800 was fun because you could see how it worked and admire how it
was designed. What do you have to hide? 1/2 :-)

Source record: 241346

1.) I keep hearing about aesfast.a and vdifast.a as GEM libraries. How
can I get them. Are they PD? (Is there a new version of Sozo C on
terminator? I have 1.1x [or some such])

2.) About techie info for Atari... Believe it or not, one of the things
I liked most about buying an Atari was not having to deal with all
the piracy I met with in the IBM realm. (strange, huh?) Availability
of information is what makes programs affordable (I have an entire library
based on PD software and TWO shareware programs (which I'm still looking at).

The ST is one hell of a machine. So, give us the know-how and I'm sure us
users can crank out some serious sh*t.

(I don't flame anyone, so DON'T flame me...)

3903. Spectre GCR and Sound Leech

Newsgroup: comp.sys.atari.st
Date: 1990-04-28 20:37:29 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900428.14372862.045676@SFA.CP6>
Source record: 241347

Several mail messages have arrived here asking how to pull a SND
out of an application.
What started this is off is when I mentioned that STers who have
Spectre GCR might be delighted at the Grouch trashcan. When you empty
trash, Oscar the Grouch appears, waves and on a real Mac sings, "I love
it because it's trash...". On the Spectre, a lock up occurs because
Oscar the Grouch can't find the hardware chips that the Mac has since we
are on an ST.
The solution was to use ResEdit resource editor and remove the SND
files. Oscar the Grouch now waves merrily on the Spectre GCR.
With the new version of SoundMaster, the Spectre GCRer can have Grouch
sing, giggle, or grown. Ok... that sets the stage and lays the foundation
for what come up next: SoundLeech.
SoundLeech allows the user to pull a SND resource out of a file. There
is a limitation, though. The file has to be an application, stack, or
anything that is NOT a CDEV or INIT.
What the STer has to do is to convert a copy of the CDEV or INIT into
an application. Run SoundLeech, and the sound is pulled out and converted
into a SoundMaster type sound (.sound)..
To convert the CDEV or INIT into an application, one cannot merely
change the name as can be done on the "ST side". The file actually has
to have an attribute changed. SIMPLE.
Two programs allow this to be done easily: DiskTop and ResEdit. Open
either program. Via their file selector boxes, click on the file that
needs to be changed. In our case, we want to change GROUCH init into a
program that appears as an application. Using the FILE INFORMATION
option, this can be done.
Two file attributes will be seen through this option, TYPE and CREATOR.
Change TYPE attributes to "APPL". Do this either to a copy or at least
remember, that after the sounds have been converted to restore the TYPE's
original attribute.
Now that Grouch *looks* like an application, SoundLeech will see it
and will automatically pull the sound files out. A menu selector box will
first appear asking what kind of sound resource that will be worked with.
Just press the RETURN key. The sounds will be 'leeched' out and can be
used with SoundMaster.
Incidentally, STers, these sounds can be used on the ST side also.
No conversion required after leeching. Any SoundMaster file can be used
on the ST.
Summary:

1) Convert non-application file to application.
a. Change TYPE attribute to APPL via DiskTop's or ResEdit's "GET FILE INFO"
command.

2) Run SoundLeech. Use the defaults by pressing the RETURN key.
3) The non-application file may need the SND resource to be cut out via ResEdit. Grouch certainly does since the ST doesn't have Mac sound chips.

I hope that this helps and hope that I haven't muddied things up.

>UUCP: {uunet,ucbvax}!unisoft!bdt!david |

I use Laser C from gulam, and I'm sure the same approach would work
with your shell.

1. First set up the directories like Megamax recommends. Then
set up the environment with something like the following:
(This specific environment expects all files (incl sources) on the same
partition.)

```
set develop c
set megamax $develop:\megamax #location of megamax excecutables
setenv CCOM $megamax\ccom.ttp
setenv LINKER $megamax\ld.ttp
setenv MAKE $megamax\make.ttp
setenv CC $megamax\cc.ttp
setenv CINCLUDE $megamax\headers
setenv CINIT $megamax\init.o
setenv CLIB $megamax\
setenv LIBPATH $develop:\megamax #location of megamax libraries
```

2. Make the megamax directory an executable path:

```
setenv PATH $develop:\megamax,...
```

3. Then use the following to compile

```
ccom -I$megamax\headers file.c
```

4. ... and link to the standard C library:

```
ld $megamax\init.o file.o -Lc
```

5. Set up makefile's as described in the manual and they work directly in this environment.

I downloaded uw.arc, but couldn't get the ST to run. I read that it only supported Monochrome, so I loaded in a mono emulator I had. (The one from Terminator) Well, it still didn't run, so I downloaded uwsrc.arc, which had a file called bin.arc in it, which had some font files and stuff in it. Well, it almost ran, at least it gave me two bombs before exiting to the desktop!!

Anyway, has anyone got it to run? I found the Unix sources at terminator under atari/telecomm/uwbin.tar.Z (I think, I know it had the extension .tar.Z.) It compiled just fine on the NeXTs we have here.

Ryan

p.s. Also, it had the files for a MAC in the Unix source file, for people with Spectre out there.

3907. DCDESKTOP

Newsgroup: comp.sys.atari.st
Date: 1990-04-29 02:01:58 UTC
From: MAXG@SUVM.BITNET
Message-ID: <9004290701.AA28404@ucbvax.Berkeley.EDU>
Source record: 241251

Well, I just got my copy of DCDESKTOP. It looks pretty interesting, although I really haven't done much more that install it and see the interesting icons included with the program. I just have one question so far: In a readme file on the disk, it is stated that TurboST 1.8 will effectively disable DCDesktop. Once I had DCDesktop installed I added QuickST 1.8 to my auto folder, and that seems to have disable DCDesktop, too. Is there a mistake, Mike? Was the file supposed to have said QuickST 1.8 instead of TurboST 1.8? I found this quite strange, since the package includes a demo of QuickST 1.8 in addition to the DC programs. Anyone out there know? (Sorry I didn't write to you directly, Mike, but either I haven't been able to get email to you the last few times I tried, or perhaps you just weren't answering email at those times.) Darek or Ignac...do either of you know?
Thanks very much...I'll continue trying other various things with DCDesktop for now.

Does anyone know of a good (or even average :-) PD or shareware
sample editor that will work on samples such as play.ttp and newbell
use? If so, where can I find it (terminator,etc)?
Thanks in advance,
Brian Daniels
(cs01bd@unccvax)

3911. play.arc v1.1 available at terminator

Newsgroup: comp.sys.atari.st
Date: 1990-04-29 15:47:46 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr29.154746.27715@wam.umd.edu>
Source record: 241258

Version 1.1 of play.arc is available at terminator (35.1.33.8). This
version replaces the previous version posted and fixes a few bugs.
Additionally, playback speeds up to 21kHz now work, so most samples
recored at 22kHz sound OK.

I replaced the old play.arc with the new one, so

terminator:atari/music/samples/play.arc

now contains version 1.1.

>or two problems. Basically it will not read unix lharc files. This is rather
>a nuisance as it appears that the source code was archived with unix lharc
>and it thus wont extract its own source !

At last! Someone else has noticed this. I posted something to this
effect two weeks ago and received exactly one response from someone who
claimed that unlzh1[246].prg would pull it apart. Well version 1.2 and
1.4 had exactly the same result... 4 or 5 copies of files with strange
names overwriting each other. I don't have unlzh16.prg to test against
the lharc113 lhz archive.

If anybody did get the archive unpacked, or if there is a newer version,
PLEASE send me (and olorin@tardis) email. If I can just once get my hands
on the source code, I can patch it so that it will accept \ AND / as
directory separators.

3919. Version 1.01 of click.prg available

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 00:32:42 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr30.003242.2207@wam.umd.edu>
Source record: 241261

Thanks to Samuel Streeper for pointing out a bug in Digital Keyclick.
I've updated terminator:atari/music/samples/digistuf.arc to include
version 1.01 of click.prg. (terminator = 35.1.33.8)

The problem was with a conflict between Digital Keyclick and the
standard ST system beep. Digital Keyclick was not cleaning up
the sound chip properly, which resulted in an annoying high pitched
whine. Yow. Since I never have the standard ST system beep on,
I didn't notice. Oops.

If you've got 1.0, save your hearing and upgrade to 1.01.

3920. Bob Brodie in Rochester (mini-review), and TT talk

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 01:41:58 UTC
From: sale5312@fredonia.UUCP
Message-ID: <1837@fredonia.UUCP>
Source record: 241263
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Yesterday (4/28) I was able to attend the talk Bob Brodie gave at the Rochester Institute of Technology. I went with 8 members of my local ST user group, The Buffalo Region Atari Group (BRAG-ST). In total, I would estimate the total number of people who attended the talk would be about 80 at the Webb Auditorium at RIT.

Mr. Brodie brought along with him a 4 MB 4160(?)STe, a 4MB Stacy, a Lynx, a Megafile 60 HD, and a 44 MB removable HD system. He spoke about each unit, which lasted about 40 minutes, then took Q&A for about 1-1/2 to 2 hours(!). Maybe longer, I lost count...:^) Mr. Brodie mentioned that all the products he was showing were *not* vaporware, and were shipping..."somewhere"... For your Lynx fans, he mentioned that he hoped that there would be over 20 games for the Lynx by X-mas. (The STe is shipping, but I believe Atari is having doubts about shipping the 4 MB version.)

Mr. Brodie showed the Lynx commercial that was test-run in NYC and other places. I see it quite often living near Canada on the CBC.

Mr. Brodie also mentioned that Atari feels that the 130XE is no longer a "power without the price" computer, and will phase-out the 8-bits. I am sad to hear this (I started out with a 400 many moons ago), but at the same time it is understandable. A 130XE + disk drive is just about the price of a 520STFM. He said that the last 130XE has been produced (a 50,000 run?) but they'll be used in house for the exchange policy. Argue if you want, but the 8-bit era is over in the 90's. :^(

After the Q&A finished, there was a raffle of the 80-col card and the word processor built for it (8 bit), 5 or 6 TOS 1.4 upgrades (both 6 and 2 chip sets) and also the Megafile 60 HD he used for the demo. (Although I didn't win anything, other members in my BRAG group won the Megafile 60 and three TOS 1.4's...hey- gotta BRAG, right? :^) Oh yes, tickets were only $1 ea. for the raffle, and I guess the show was free. Also the *new* Lynx cart, Gauntlet, was a prize in the raffle.

The show concluded with an auction of Atari products of a store that phased-out their Atari line. Several titles went under $4. VIP Professional, still in the cellophane wrapping, went for $10. I picked up Infocom's "Deadline" (ST), a Chinese cooking database (ST, for my girlfriend; I'm a vegetarian...:^), a Logo book (was bundled with the cooking program), and the 130XE and DOS 2.5 manuals (XE) all for under $6 total. After the auction the group left the Auditorium and went to a pizza party with Mr. Brodie, with tickets costing $4. BRAG did not stick around for the pizza.

After seeing the show I left disappointed. Not at all with Mr. Brodie;
I was very impressed with him. I've been to several shows along these lines
(Atari, Apple, NeXT, etc.) and Mr. Brodie is one of the best speakers
(and perhaps more importantly, *listeners*) I've seen. He is a real credit
to the Atari family, and I hope he sticks around for a while (lifetime
contract would be ok...:^) I think Atari can sleep at night knowing that
Mr. Brodie is one of the people contacting us peons who use or want to
Atari computers. If any Atari junkie has the chance to see him talk,
I recommend it.

So why was I disappointed? Maybe because I am sick of the "game machine"
image Atari has. My girlfriend who also attended teases me about how my
ST is a game machine (friendly, but others aren't that nice.) Although
I am very happy with my ST (I couldn't have survived college without
1st Word, Thunder, Uniterm, etc.), I would like a faster unit and Unix.

Faster unit and Unix. Ah ha! The TT! Let me state that if Atari
introduced the TT (Unix, 68030, runs ST software too) for under $3000
a year ago I would have been first line for one (well, maybe not
first, at least until I could have raised the money.) Now I'm not so
sure about getting one ASAP, if at all. The great majority of
questions was about the Lynx, local dealer problems, etc. There
was one or two about the TT, but nothing much was said. Of course,
this is because it is not being manufactured now which is understandable,
but there seemed to be zero interest in the machine. One of the reasons
I went to the show was to find info on it, but all I got was that the
TT passed FCC tests and software was being worked on now. Mr. Brodie did
not give a release date (i.e. "very soon", "September", etc.) which I
think is a good thing. Instead of the "very soon now" or "{1,2,3,4}
Quarter of next year", saying nothing about a release date will not make
him (or Atari) look bad should the machine fail to appear (nah...that wouldn't
happen, would it? :^)

If the TT appears late this year or early 1991, I will not buy one for
at least two years. Why? First, I bought my ST in October of 1985, and I
thought that this would be the machine that would defeat the Mac (or at least
come very close to it.) I didn't think that even Atari could mess it up.
But what happened? Instead of getting the (then) under-$1,000 512K 68000
based machine (i.e. power) into colleges and business applications, it's
sold through Toys R Us. Toys R Us? Think of Toys R Us. What do you
think of? I think of 3-to-5-year-olds running up and down the store. If I
don't want to buy a computer there, would upper-level executives? Or people
in charge of universities? And what about support?

I thought that Atari, having a reputation problem then, would give away
ST's (or at least make a *huge* discount) to universities to follow
Apple's lead. That would at least get them "in the door". And I don't
think many places would turn down a free Atari computer because at
least they would have been able to play games if nothing else. :^) Let's
hope Atari doesn't make the same mistake with the TT.

So, to get back to the meeting: with three user groups represented,
I should be able to assume that there was a deceint sample of Atari users.

And if nobody had enough interest to press about the TT (at least get a few more "no comment at this time"'s from Mr. Brodie, should I, an Atari ST user, be worried? That is one thing I haven't figured out yet.

Who is Atari going to aim the TT at? (Let me assume that the TT will be 68030-based, run some flavor of Unix, and be ST upward-compatable.) Will Atari try to sell the TT to the current ST userbase as an upgrade? I hope not, at least as a major source of sales. Sure, there are some of us who would love getting a much faster ST *and* Unix, but the majority (at least a good number) I'd guess of current ST users don't really want Unix. (This will be debated here since about >90% of you reading this via Usenet are probably using Unix right now, either rn, readnews, etc.) I got to see for the first time a bunch of ST users (ok, just 70), but they didn't seem to know what a Unix is or if you have to feed it and burp it. That's fine, but why should Atari try to sell them a TT? I think they shouldn't. You can have a zillion computers sold, but how many will push Unix to the limit? How many will even use the Unix end of the machine?

Ok, then who should Atari sell the TT to? How about schools? If they could offer a big-fat discount to high schools and colleges for a machine that runs both Unix and the pre-existing ST software line and bundle a bunch of PD and/or commercial ST software that shines on it, I think Atari would advance to the next plateau from "game company" to whatever in many eyes (important ones at that.)

I would love to hear in about a year or so, people from the educational and business world saying "Atari finally made a *real* computer this time!", and us past and present ST owners (and 8-bitters for that matter) would just smile and say welcome to the world of Atari...

Last week I attended a NeXT demo at my school, and I really liked the machine. The problem I have is that at over $10,000, I don't see myself getting one (unless I win the lottery or something, but since I don't play I don't see myself winning...:^) It's a really fine computer that's worth the >$10K, but for the low-to-medium user like me? It's just not practical for what I'd use it for at home (little word processing, and Really-Not-Professional C programs...at least not the commercial type...) I suspect that there are a few others out there who would like to have a Unix computer, but can't afford the current crop. If the TT could fill this void (be under $3000) Atari's got a hit on their hands, *if* they sell it as a Unix computer first, ST compatable second. "Runs Unix and has a library of programs that can already be run on it too!" would be a nice pitch for the TT. I just can't see Atari hoping to sell the TT *only* to the current ST user base.

To conclude (finally...), I hope no one takes the above as Atari-bashing, which has in the past been fashionable in these newsgroups. I've used an Atari computer since 1983, going through a 400,600XL,130XE, and finally a 520ST w/1 MB. I've sold everything except the 600XL (still 16K, no drive) and the ST. I am hoping I will not have to leave the Atari world. I'm really hoping Atari breaks into the "serious" market with the TT. Should they start to

sell the TT to a more serious user market (not through Toys R Us),
I'll be in line to get one. If I can play Kreskin for a moment,
in five years time, I think I'll be working on a newer computer with a
little Fuji symbol on it...:^)

3923. GEMFast & MWC (possible?)

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 08:32:14 UTC
From: harryk@bucsf.bu.edu
Message-ID: <56471@bu.edu.bu.edu>
Source record: 241269

Hi folks,
has anyone managed to get GEMFAST 1.3 libraries work with MWC?

Since I don't have the source code of GEMFAST 1.3, I tried to extract all the .o files from AESFAST.A & VDIFAST.A, convert them to MWC's format and built them back to 2 libraries that MWC can understand. Unfortunately it didn't work....MWC (and its support utilities : ar, drtomw, etc) keep complaining about GEMFAST's object files.

So if someone has already done it PLEASE let me know....

(if I remeber well, the source of GEMFAST 1.2 was written in the Madmac assembler which happens to be a very "unique" assembler - i mean it uses commands that give headaches to any other assembeler -, and since i don't have madmac (you see i'm not an ST developer) i couldn't use the source-code even if i had it)

Since this is not of general intersest please answer via E-mail

From: dartus@datlog.co.uk
Message-ID: <2846@dlvax2.datlog.co.uk>
Source record: 241289

A friend wishes to do some WP on an atari ST (or Amiga !?) and particularly needs to use accented characters etc. He is especially interested in the usability of the software when entering such characters, having to hit all manner of control/alt/escape keys to get an 'e acute' does not appeal.

Does anyone have any prefered Software for this purpose?

Replies by email please.

Thanks, Dave Artus.

And prone to be inaccurate. I've dis-assembled hundreds of boot sectors, which are generally 300-450 bytes of code, been puzzled by some things, wrong about others, and fooled by still others. I've done larger items regularly, and it is very subject to interpretation. More so when the code is the output of a higher level language, rather than originally written in 680X0 assembler. Since I've been in this business for well over 20 years, and written several dis-assemblers, I tend to think I know what I'm doing. Dis-assembly is not a science, it is an art, even with a sophisticated, interactive dis-assembler. And not a totally reliable one, no matter how good your dis-assembler is, or how much experience you have in reading/writing code.

>How do you think all of the IBM clone manufactures came up with
>*their* ROM BIOS and XBIOS stuff? Do you think they went up to
>Big Blue and said "excuse me, could you please give me a copy
>of your ROM code? I'd like to rewrite it for cloning."

Those who did it by the means you suggest have been sued out of business. The BIOS code still available through other sources was done via the "clean room" technique. A group of programmers who demonstrated no knowledge of the code in the ROMs were assigned to write a BIOS. A second group who were familiar with the characteristics of the BIOS tested the results of the first group, and pointed out where their code acted differently. The first group then revised their code. This technique was tested in court, and found to have been legal. All other methods (that I am aware of) have been ruled illegal, and the products removed from the market, or subject to licensing fees.

>Place cache90.prg in the auto folder. No other auto program. Cache90
>says: no cache buffers added. Is this normal?

No. However, it is understandable when you realize how the program
works. It (cachexxx) searches for it's own name in the directory to
determine the size of the cache it is to allocate. It does this by
searching the current directory, then /AUTO on the default drive, and
then (possibly, this was a while ago) the root directory on the boot
device. Since the autoboot sequence doesn't set the current directory
to /AUTO, the current directory is the current drive (usually C: at
boot time). Consequently, if there is any file named CACHE???.???
(that's cache ANYTHING) on drive C, even a hidden file, that is the
entry found. If the last three digits of the file name are not numeric,
CACHE does not get a properly parsed size value, and logs the error
message. Check your directory for such things as a hidden "CACHE.INF"
from another caching program (that's what did me in).

Since TOS does not oficially give a program its own name, this is (in
my opinion) a reasonable approach to the task of building in a parameter
for an automatically executed program. The only other alternative that
comes readily to mind is a separate parameter file. That makes the original
program that much more complex, adds another level of maintenance, and
opens another window for problems.

3927. Zoo help...

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 13:40:53 UTC
From: ieeug292@Eagle.oscs.montana.edu
Message-ID: <00935F86.6D0B9B40@eagle.oscs.montana.edu>
Source record: 241276

I'm fairly new onto the ftp scene, and all the zoo'd and zoo/unzoo binaries I've downloaded in my entire life are from Terminator. The basic problem I have is in such an instance as with Nethack 3.0. A zoo file 400+ K long, extracting into the neighborhood of 750 K, unless someone bothered to install a 1.44 meg 3.5" or has 2meg+ Ram (neither of which I have with a 1040st), then it is quite literally impossible to exract all the files.

I've tried to extract files individually, but with little or no success.
Thanks ahead of time.

3930. Public domain GEM resource construction program

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 14:26:02 UTC
From: charltn@ccu.umanitoba.ca
Message-ID: <1990Apr30.142602.19589@ccu.umanitoba.ca>
Source record: 241277

Several people have been asking about a public domain GEM resource construction program. I asked the same question last fall with no responses and so decided to write one. The resulting program has just been sent to comp.binaries.atari.st and should appear in the near future. The program is called MKRSC and will create menu and dialog resources. It will not (as yet) create icon objects. It has all of the usual bells and whistles including .C output.

The program was extensively tested (resulting in many improvements) by Jwahar Bammi and Sam Streeper who put almost as much work into it as I did by testing the multiple early versions. Thanks a lot guys.

The program works in mono and should work in color... but was not extensively tested in color. Any comments re problems or bugs will be very welcome.

The sources (Laser C) will be posted to comp.sources and have also been massaged by J. Bammi to make them compatible with the gcc compiler.

If there is enough interest perhaps I will also post a short demo program illustrating how to use the basic GEM functions such as windows, menu bars and dialog boxes.

3931. IMG files

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 14:39:26 UTC
From: n-waters@NIMR.MRC.AC.UK
Message-ID: <9004301439.AA04193@nimsn41.>
Source record: 241264

It has been well documented on how .IMG files are constructed in
various magazines and listings on the net, however no one seems to explain
how they are set up in the ST whwn they are loaded.

eg. You have an IMG file 1000x1000 pixels you want to load into high res.
So you start decoding your first line and get to pixel 641, where does it go?
Presumably you set up another screen area further along in memory ie at
1000 lines hence (to allow for the 1000 vertical lines), and continue with the
remaining 320 pixels here. Is this true or am I totally up the wrong tree.
Then to scroll around the picture the same technique is used as for scrolling
long Degas pictures.

All help gratefully recieved and summerised for the list.

thanks in advance,

Nick.

3933. RE: Atari documentation.

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 15:08:37 UTC
From: n-waters@NIMR.MRC.AC.UK
Message-ID: <9004301508.AA07935@nimsn41.>
Source record: 241265

Over here in the UK in the late 1970's early 1980's when home micro-
computing became affordable and popular, when a new machine had been on the
market for a few months it was standard practice for lots of user books to be
published which included ROM dissassemblies etc etc. Quite often circuit
diagrams
were also published.
So as to Atari, Why cant they produce a set of definative manuals for
the ST at an affordable price. This would stop mal-programming, would
encourage more and better quality programmes to be written etc etc. To take
two examples wouldn't current software be much better if everyone used .IMG
format for graphics instead of having to fight through 7 or so other specs;
also wouldn't it be great if we all used GDOS properly, again not having to
cope with several in house product fonts, the latter by now would surely
resulted in more GDOS fonts being available (a la Mac), and also more drivers.
Ok so I know there is the Abacus set of books available but they are
straight reference books (with and without mistakes), but to someone starting
out down the road of programming for example 'The Gem programmers reference'
is about as useful as a brick to someone who is drowning!
So back to Atari. You guys youve got the data, youve got the ability,
why not do it. Just think of the money.......yes money......
Do I detect ears perking up.
Money.....
Yes, as you say over there, 'Theres a quick buck to be made'.]
Money....
Put together some reasonable manuals which give us the information we need,
yes need if good programmes are to be written, put some faith behind the old
ST's, and while youre at it make a few bucks(strange currency...rabbits), or
dollars or whatevers.

great product shame about the user support,

Nick.

Disclaimer: these must be someones thoughts.

PS. If you cant do this, lets have someone on the list from Atari, whose a
real nice guy and is prepared to send in essays on topics eg 'How do virtual
workstations work'. Failing this what about Holding topic conferences where
each month a specific topic is chosen and milled over. Then summaries of the
useful info can be archived for future use thus saving lots of repetative
queries on the list being ignored etc.

3934. Anyone installed GNU Emacs on ST?

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 15:36:20 UTC
From: rcb@ditka.UUCP
Message-ID: <24302@ditka.UUCP>
Source record: 241283

I am having a problem installing the TOS port GNU Emacs 18.55 which is found on panarthea. All that's described below happens when I attempt to 'dump' the executable version by loading lisp files into it with temacs (the first step.)

The first (minor) thing was that 'loadup.el' seemed to want filenames with -'s (dashes), but the filenames in the distribution had _'s (underscores). I fixed that and a similar quirk in the site-initialization file.

Now, after the site-initialization file has been loaded, the whole process bombs with "End of file in parsing". Has anyone had this problem before and found a work-around? (or even a 'word-around'? erasing the problem in a puff of logic ...)

Thanks!

>Well, I just got my copy of DCDESKTOP. It looks pretty interesting,
>

I am very curious about DCDESKTOP. There was a good review of it in ST Informer last month, but they failed to mention one critical point. How much RAM does it consume? Can that RAM be reclaimed when you launch a program? Does DCDESKTOP reload automatically when you quit a program?

Any light you can shed on these questions will be greatly appreciated. BTW I noticed the first of several demo files for this program in the binaries. Maybe they will have the answers.

Shalom, lawrence

I don't have an opinion. And if I did it would not represent my company.

3936. setting the color of points in GEM

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 15:45:48 UTC
From: rcb@ditka.UUCP
Message-ID: <24303@ditka.UUCP>
Source record: 241284

I am a rank beginner at GEM programming, equipped only with Abacus' GEM programmer's reference as a guide. Currently, I want to start simple and simply write a program to plot a bunch of points (polymarkers) to the screen. However, all my points come out black, which the reference manual says happens when the color index passed to vsm_color is invalid. I even use vs_color first to define my own color indices and use only those I've defined. I'm stuck, so I'm wondering if anyone knows of any errors in the manual, dumbnesses on my part, etc. I am using version 1.3 of the GEMFast library and version 1.1 of Sozobon C.

Thanks!

From: mcallist@bambam.UUCP
Message-ID: <1123@bambam.UUCP>
Source record: 241270

From article <1990Apr9.125813.635@gpu.utcs.utoronto.ca>, by romwa@gpu.utcs.utoronto.ca (Royal Ontario Museum):
> After some fanangling I have PC-DITTO working. There is still the odd
> glitch, but overall I am pleased with it.

Same here. I waited five months, but all in all, it seems to have been well worth the wait.

> When I first installed PC-DITTO it complained a lot about things not
> being setup up correctly. This turned out to be the now infamous
> connector which clips onto the CPU. You have to bend in all the pins
> to give it a snug fit. I also ran into the PAL problem which
> Avant-Garde fixed quickly with a couple of new PAL's.

My 1040STf has the same problem, and required me to return the clip-on 68k connector for one that has the cable pins pointing the other way. Turnaround was about three weeks, during which time an envelope with replacement PALs magically appeared; so I just put them in rather than worrying about the older ones. They seem to work fine.

> This weekend I happened to notice a new phenomenon: During the first 15
> minutes of use I can sometimes hang PC-DITTO. I suspect that this has to
> do with the connector/cpu heating up and expanding. I am not thrilled

The pin-bending trick for the piggyback connector IS NECESSARY...but not necessarily sufficient. Mine will fail after a warmup cycle which varies from about 6 hours for the first failure, down to a few minutes eventually (even after sitting overnight). Then I have to take the 1040 apart and re-seat ALL the connectors. Avant-Garde told me over the phone (best time to get them, by the way, seems to be first thing in the morning...) that the cable wires attach to the connectors via pressure prongs, and may need soldering. However, I would check with them personally about that, to avoid warrantee problems.

Also, the stick-on sponge-rubber pad they supply to protect the bottom of the board doesn't prevent protruding chip pins from sticking through the pad and shorting against the 3" x 4" metal RF cage on the motherboard. I found that a strategically-placed piece of cardboard (e.g. from a disk box lid) offers the final protection.

> Oh and another thing I would advise you not to try to stuff everything
> back into your case. I did (minus the RF shield) and ended up putting
> a crack in my keyboard PC board. Thanks to Peter Hiscocks for fixing

The cracked keyboard comes from the fact that, if their board is installed a la Avant-Garde's instructions between the power supply and the floppy drive, a chip on the PCDII board presses against a crystal case on the

underside of the keyboard, causing that board to bend when the 1040 is bolted back together. I found that I could alleviate the problem by:

a) re-attaching the rear support post (behind and to the left of the floppy drive) to the bottom of the case by its screw, and cutting it off 1/4" below the top of the lower 1040 case for support of the PCDII; then

b) turning the PCDII board END-FOR-END [I know it disagrees with their instructions, but this works! The cables are folded as follows: Plug the large cable into the piggyback connecter; bend it to run 90 degrees to the LEFT about an inch; bend it so it doubles back on itself until it is over the PCDII board; then bend it away from you so it runs to the connector on that board. Then repeat for the small cable--works great! CAREFULLY adjust your bends so there's NO strain on the piggyback connector, then crease the cable bends]; and finally

c) adding support to the keyboard by gluing a couple of struts to the underside of the board--one near where the front strut was broken off, and one near the right front corner of the power supply. For the supports I used Popsicle sticks (really!) cut to size. They're strong enough to support the keyboard when you lean on it; yet not hard enough to scratch or dent your circuit boards.

Other notes:

The jumper wire which comes with the kit, for bypassing the math co-processor, is too thick for the job it is supposed to do, and bends the 8087 connector pins when installed. Using a thinner wire is advisable.

Avant-Garde supplies a file to set the PC clock from the ST keyboard clock. This used to work with PC-Ditto I, but does not with PCDII. They say they are working on it.

I can't get MS-DOS to boot off my Megafile 60 hard drive (have to have the system files on a floppy); but it boots fine from an SH204 hard drive. Avant-Garde says I probably need to install some patches which came with the earlier PC-Ditto; they said if I didn't have them to send them a formatted floppy and they would send same to me. All in all they've been very cooperative.

3939. More on The Vault / The Key

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 17:32:07 UTC
From: mcallist@bambam.UUCP
Message-ID: <1124@bambam.UUCP>
Source record: 241271

The Vault and The Key are both great. I lost my hard drive, complete with nearly 40 meg of files, a mere three days after having backed everything up with The Vault. Restoring all to its former pristine perfection was just a matter of running The Key, inserting the floppies one after the other, and I *would* have been up--except for one small problem:

Because I am a clumsy typist, and careless on top of that, I habitually set each file I have to read-only status. (Can't be too careful...) Vault/Key, of course, faithfully copies these attributes, along with the files; and restores them when rebuilding the disk.

UNFORTUNATELY, if The Vault has split a large file over two floppies, when the first half is restored, so is its read-only attribute. That means that the second half cannot be appended, because THE FILE IS NOW LOCKED! I had to go through all my precious backups, with no hard drive to fall back on, and write-enable every file in every folder on every floppy...and then re-disable them on the hard drive when the restore was done. Because of my above-mentioned clumsiness, I even inadvertently deleted a file off a floppy (not a very important one, but I wish I still had it).

Vault/Key, because of its ultra-fast handling of files, efficient use of floppy space, incremental backup capability, history file, and general-purpose fast copy features, is a terrific utility; but it will be even better if this small but annoying bug is fixed. And thanks for letting us use it.

3940. Patches #1 and #2 for Sozobon C, release 1.2 (repost)

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 17:42:08 UTC
From: mj@myrias.com
Message-ID: <65729j2a@myrias.com>
Source record: 241279

About old fixes for Sozobon C. For all of you who missed older
patches posting for version 1.2 here are context diffs which show
effect of patches #1 and #4 together on a released version of 'top'.
Feed this message to 'patch -l' (experience indicates). At the bottom
you will find out also attached a contents of a patch number #2, for
'hcc'. 'jas' was not re-released in a version 1.2, but patch for 'jas'
(#0, I guess :-)) was reposted fairly recently. Together with #3,
'hcc' once again, this would be like it.

Happy hacking

From: uunet!dunike!onecom!hans (Johann Ruegg)

There is a bug in all versions of 'hcc' that can occur when register
variables are declared in nested blocks. Because of it, 'jas' cannot
be re-compiled with the 1.2 release with the optimizer (-O) turned on.

In the file "fun.c", in the function "block()", change these 2 lines:

```
if (blktab->b_regs > maxregs)
maxregs = blktab->b_regs;
```

to this 1 line:

```
maxregs |= blktab->b_regs;
```

3942. uuencode format wanted

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 18:25:54 UTC
From: gary@brb.isnet.inmos.co.uk
Message-ID: <39.263c8332@brb.isnet.inmos.co.uk>
Source record: 241290

I am having problems when I extract uuencoded files from comp.binaries.atari.st on the VAX (at work), then copy them over to the PC, where they are decoded. I then copy the files onto 3&1/2 inch disks which can be read by my ST. It seems that the VAX drops any trailing spaces, and thus causes the PC uudecode software to fail. I am writing a simple piece of C code which will fix line lengths as necessary, before I copy the files to the PC. I already have a piece of ST software which knows and works around this particular problem, but find it more convient to use the work facilities.

The point of this post: could somebody please Email me the details of the uuencode format, or possibly any (short) source code (in C) which would help me understand how to decypher these files. I have an idea that the first character indicates in some way the length of the line of text that follows(?).

Please EMAIL and I will summarize.

>well-behaved programs.
>

You know, I understand what Atari is trying to do with the
marketing policy of providing detailed info with an additional purchase.
Other computers, costing much more, offer detailed information freely,
but it's payed for in the price of the initial purchase. This means that
users who want to do nothing but play with a spreadsheet are forced to pay
for information that they will never use.
The alternative marketing strategy is to charge for each piece that
a user wants, meaning that the user can purchase *exactly* what they want,
and is not charged for things that they will never use. I rather like this
policy, though it leads to a "hidden cost" feeling if the fact that the
whole system is available in "pieces" is not well advertised. This is where
part of the resentment you read on the net is generated; the other part is
from people who view the cup as half empty instead of partially full.

I really don't think people should be complaining about the extra
cost, except where they where mislead into believing they were purchasing
all that they needed when they purchased their computer.

HOWEVER:

It's equally silly for Atari or representatives thereof to complain about people disassembling ROMs, publishing incorrect or incomplete information, or programming outside the "rules".
In an ideal world for Atari, you could *enforce* rules that would avoid your "getting stuck with a feature we don't like, a feature YOU don't like" etc.; this would mean a central location controlling the product, which sounds like a good idea. However, in actuallity, you have no way to enforce the following of the rules. When you are powerless in some area, you have to come up with some way to persuade people to do what you want, even though they might not like it. You have to make it clearly in *their* best interest to do what you want; not clearly in *your* best interest, or clearly in the best interest for *everyone else*, but clearly in *their* best interest.
Frankly, it is no one's best interest to spend lots of money they haven't got (or desire to spend on higher priority items) to get information that they can come by in other ways. You have to completely ignore human nature to expect people to pay *you* to get rules that they *you* want them to obey. Yes, in the long run, it`s to the programmer's advantage; Atari may change the OS, making the program in question unusable. However, this is a long-term consideration, weighed against the short-term consideration of $$; which consideration is likely to win? You may have noticed that even corporations such as Atari have been known to focus in on the short-term, ignoring the long-term disadvantages...;-)

It's a tradeoff. Atari's marketing strategy makes sense in many ways; a completely *predictable* result is that people will generate their own information, some of it incorrect, and you may be stuck with the result.

The only way to encourage people to follow the rules that Atari desires to be followed is to make the information cheap or free. If Atari, in weighing the advantages and disadvantages of their marketing policy, decides that losing total control over the OS (or facing the public outcry when Atari changes the OS and programs which did not follow the rules suddenly fail), is too hard to bear, the only thing to do is to stop aiming at their own foot. If Atari determines that the current marketing strategy has more advantages than disadvantages, then they should maintain the status quo, and fondly bid the little toe goodbye.

It sounds silly to me to hear someone righteously saying, "No, no, that's the *wrong* way to do it, it could hurt me later, but you have to pay *me* to find out the why *I* want you to do it". If Atari wants me to do it their way, they need to show me that they've made some effort to make it easy for me to do it that way, or that they are at the very least willing to meet me half-way (hundreds of dollars does not strike me as "half-way"). Otherwise, Atari reminds me of some of the street people in New York, railing away to the heavens, while all around them people are quietly, and pointedly, not listening.

The choice is Atari's. Having made an informed choice, it should be prepared to bear the consequences. Hopefully, Atari has made the best choice.

3946. Hi-Tech ST magazines

Newsgroup: comp.sys.atari.st
Date: 1990-04-30 21:40:59 UTC
From: david@bdt.UUCP
Message-ID: <2371@bdt.UUCP>
Source record: 241288

This is an attempt at an informal survey. I hope nobody minds too much.

I would like to hear from those of you that consider yourself
fairly hard-core programmers, and those that want to be hard-core
programmers. What ST specific magazines do you read? I know
many of the magazines don't have much hi-tech information, but
do you read them anyway (including on-line mags). What other
sources of ST information do you use?

The reason I'm asking is because I am intending to write a series
of articles discussing programming methods for RTX, with real-world
examples. It will be pretty hard-core and I would like to know
where it should be published.

Please reply by e-mail. Thanks.

>Seeing how the JRI memory upgrade can give me 4096 colors cheaply, is there
>anyway to get the stereo sound cheaply?
>
>(I want an STe, but can't really afford it!!)

Practical Peripherals makes a kit called the Tweety Board, which I have installed in my Mega 4. I don't think it's all that wonderful an upgrade. It takes the 3 channels from the Yamaha sound chip and splits them up, so you can run each channel to a separate amplified speaker. It's relatively unusual to find speakers in sets of 3, so this in itself is a hassle. I bought a cheap Radio Shack stereo mixer to handle this problem, and also to mix in my MIDI stuff.

It would have been much better overall to design a kit that adds a second Yamaha sound chip. There are almost no programs I can think of that produce sound that sounds any better with the 3 channels separated. It just ain't stereo... Unfortunately, any project to add a second Yamaha chip will still be incompatible with the STe stereo. It's a drag, but I'd say you're stuck with no good way to do things. If you don't mind writing your own support for it, you may look into adding the second chip anyway. If not, forget it; there's no software that will do anything fancy with whatever mod you make.

Could anyone give me some information about the following questions:

1) What is the difference between the Atari ST and the "newer"
Atari STE ?

2) Can a 520 ST be upgraded to STE specs ?

3) How is the Atari ST doing in the computer marketplace (O.K., this
is a relative question - but I ask it because I have heard that
some major software companies were slowing the development of
their software for the ST because of lagging ST sales worldwide.) ?

4) How is the ST competing (saleswise) with the Amiga worldwide ?

Thanks in advance for your help !!

From: mike@mgh-znmr.harvard.EDU
Message-ID: <2742@husc6.harvard.edu>
Source record: 241297

A couple of recent messages have mentioned problems with uw. For what it's worth, I've been using it heavily for several years, with few problems. (I occasionally use UniTerm if I want Kermit or one of the *modem protocols, and I occasionally have problems if I accidentally get tangled up, so that Unix thinks I'm running with windows, and I don't, but other than that, I like it.)

For what it's worth, I'm running an old version (the latest dates I can find on the UNIX end sources are 1985; the ST end is just binaries, but date from about the same time.) My binaries match those available from the archives. The main thing I can see that is different between my installation and those described is that I run with a true mono monitor, not the emulation software.

This is not a bug, really. The original PC-Ditto that I have documents this "bug" in the manual. The program captures the time in a register somewhere and when the IBM boots up, it restores with that time when you ran the program to begin with. So what I am trying to say is that the PC-Ditto I ver 3.0 manual does state the time problem.

From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000065@ux1.cso.uiuc.edu>
Source record: 241287

```
Shell users: (esp. Gemini)

if this is useful, I just posted it to terminator as xmore.arc.

XMORE.ARC:

When show (or Ansehen) is clicked on in Gemini, xmore will
take effect if there is an

alias more xmore

in your mupfel.mup or gemini.mup file. It will view Degas and .DOO
files on its own and any other file for which you have a standalone
viewer.

e.g.

in my mupfel.mup is:

alias more xmore
setenv MOREDFT e:\bin\more.ttp ; SMORE.ARC at terminator
setenv MOREARC e:\bin\arc.ttp,v
setenv MORELZH e:\bin\lzh.ttp,v
setenv MOREZOO e:\bin\zoo.ttp,v
setenv MOREDOC e:\tempus.app
setenv MORETXT c:\auto\qview.prg
setenv MOREPS g:\uscript\uscript.prg
setenv MOREDVI e:\tex\dviprev.prg

i.e. it is fully configurable depending upon your other viewers as
well as command line options (following the comma).

p.s. I was trying to have it do .IMG files as well (on its own),
but really couldn't make heads or tails of the PICFMTS.DOC
at terminator. Maybe there is a viewer out there I could
configure it to use.

I just got a Spectre GCR a couple days ago (at the Pgh. show), and it seems to be having problems. I can start it up normally, and get to the point where I insert the System/Finder disk. It proceeds for a while - I get the sad-looking Mac, the 'Welcome to Macintosh' display, and then the crash page. It says it's a bus error. The bus cycle was not one of the ones mentioned in the manual, it was 65..... I ran the self test, first the quick test. It did fine until it got to GCR format, then it started giving me an error message, something like 'Initial RESTORE failure in XRESTORE', which kept scrolling up and off the screen. I got it to format and verify using those commands alone. Also, it does not Read All Sectors very well. On the included MAc PD disk, it read only ~1/2 of the sectors correctly. So, any suggestions on what to do? By the way, I'm using a 1040ST (non-upgraded in any way), a color monitor, and one internal drive (not the ideal setup, but I'm working on it). Thanks...

3962. Looking for harddisk backup software

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 14:09:19 UTC
From: ski2@milton.acs.washington.edu
Message-ID: <3221@milton.acs.washington.edu>
Source record: 241300

Organization: University of Washington, Seattle

I am looking for a harddisk backup and restore program that will backup large files across multiple floppy disks while keeping the folder hierarchy intact. It would be nice if it could do file compression also. I am also looking for a harddisk tools package that would allow me to recover lost files and optimize the harddisk for reads or writes. I am running TOS 1.0 on a 1040ST.

Thanks in advance.

>with the boot sector only.

Yep, there are. Quite a lot actually but there're not very widely spread.
I know at least one viruskiller that checks for linkviruses, the
Anti Virus Kit (AVK). It checks files for linkviruses, but cannot repair
them since this is quite hard to do.

3964. GCC-137 Zoo files

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 14:24:17 UTC
From: asqb-sep-a@HUACHUCA-EMH2.ARMY.MIL
Message-ID: <9005020704.AA26393@ucbvax.Berkeley.EDU>
Source record: 241080

I tried ftping gcc-137.zoo01 through gcc-137.zoo13 from terminator. I used BINARY mode from an Intel320 acting as a DDN node on MILNET.

I then downloaded them from the Intel to my ST. 01 unzooed OK until it hit tm_m68k and then it gave me a corrupt header in file and quit. When I list all the others (02 - 13) I get bad archive error messages and can't even see what's inside these files.

Has anyone else experienced difficulty with these or is it just my host? All the files came through with the corre.

I've tried zoo on the ST and also a PC at work although the PC version is only 1.31.

Thanks for any help - I hate to have to FTP them again.

3966. Opening Modem in C/Related ??

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 14:54:00 UTC
From: gwg33762@uxa.cso.uiuc.edu
Message-ID: <46300093@uxa.cso.uiuc.edu>
Source record: 241068

Could someone explain:
(1) How to open an AUX: port to the modem
(2) Set the baud rate, etc.
(3) Check the status (ie is a character ready to be gotten)

I'm using the standard AES/VDI/BIOS/etc. routines in Mark Johnson's C but have only the vaguest documentation. What is the best, inexpensive source for information on these routines? I have heard of the ABACUS books. Which one (if there is one volume) contains brief but adequate coverage of all of the ST OS routines?

On a related note, has anyone compared the power/speed of MJC with Sozobon, set up the GEMFAST libraries with either, and or know what the file OSBIND.H on terminator is??

3968. Personal Finances on Atari ST512

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 15:58:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9005020705.AA26459@ucbvax.Berkeley.EDU>
Source record: 241081

To expand on Troy Carpenter's reply to an earlier query:

The current version of Phasar is 4.0. I have seen it in the Joppa price list for $US54.00. I did an extensive review and tutorial on the product in the March 1990 Current Notes. I feel that it sets the standard for this type of program and it is relatively economical. The support to date has been very good, although some may quarrel with the price of the upgrade from ver 3 to ver 4. While the new release is not an entirely new product there are extensive improvements to the user interface.

This program also does a splendid job of handling taxes, budgeting, and other matters of personal finance.

I suspect that an ST 512 user would find it somewhat cramped. I would encourage and 512 user, particularly one who is using a hard drive, to stuff in as much me memory as he can. He will want it for things like NeoDesk, Hotwire, UIS III, and the like, which are all essential to making operation on an ST smooth.

3971. supercharger

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 18:03:25 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <3301@calvin.cs.mcgill.ca>
Source record: 241066

Well, just wanted all of you to know that I am now a proud owner/user
of supercharger. Just about everything works great.

Originally I was having trouble printing with it, but that was due
to the fact that I had pq.prg resident, which is an ST print spooler
which interferes with Supercharger.

Basically, it is a pretty decent PC-emulator. It comes with decent
documentation, a short DMA cable and a stupid little power line which
plugs into your joystick port (note - there is a batch of powerlines
in superchargers which are wired BACKWARDS and will not work. If your
local dealer is having trouble getting one to work, this might be the
problem).

It also comes with DOS 4.01 and a few handy utilities which make
installing a dos partition on your hard disk quite painless,
and a few other handy utilities which make your Atari mouse look like
an MS mouse, and make your ST disks readable in IBM mode (so you don't
have to write boot sectors), etc.

I bought a transformer at Radio Shack for $12, since I needed one anyway
due to the fact that my 1040ST power supply already has a lot of work
to do in order to support 2.5mb of memory. I threw the powercord in the
trashbasket. (I like having joysticks plugged in my joystick ports).

Some interesting things about this emulator - it has 1mb of memory inside
it which you can use as a ramdisk from ST mode, and if you go into IBM
mode, it automatically detects any ST ramdisks and lets you use them
as if they were in IBM memory!!

The built-in character font is a little strange, but it is readable.

I ran it with these programs:

telix (modem worked fine)
wordperfect 5.1 (mouse and printer worked fine)
xtree gold (everything worked great)

One annoying thing is that it is not possible to switch out
of the Supercharger mode without rebooting the ST, and it isn't possible to
switch back into Supercharger mode without rebooting the MS-Dos. Supposedly
it will be possible to go in the second direction within a couple of months.

I had a couple of tech-support questions to ask, called and left a message
last night, and someone CALLED me back first thing this morning (pacific
time). So to sum it up, I am impressed!

3972. Portfolio file exchange

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 18:12:09 UTC
From: silvert@cs.dal.ca
Message-ID: <1990May1.181209.24049@cs.dal.ca>
Source record: 241059

Recently someone posted a query about file interchange between a Portfolio and an Atari ST. It sounded as though he was using the serial port, but is there a way to transfer files through the parallel port as with the PC? Currently I get text files on my ST, which is connected to a modem, and then I copy them to disk, and then I put the disk in my laptop, and then I can transfer the files to the Portfolio. If I had an ST equivalent to the server on the PC I could transfer files directly from the ST hard drive to the portfolio -- that would be handy.

On all this discussion of disassembly and lack of information for nondevelopers I like the analogy to car service manuals pretty well. They don't come with the cars, but the company does need to produce them anyway. If you really want want you can order one at the same time as the car. The last time I did this they cost aabout $20.00 for a pretty big book. I am sure that you would here a lot less complaints on the net if Atari published the technical information on its computers in a well edited from at a similar cost per page.

3974. Re: STE TOS / TOS 1.4/1.6 etc.

I don't understand the incredibly negative comments regarding
the developers program at atari. For an investment of $300
five years ago I have received a continuing stream of documentation,
information, and software. The quality has improved steadily since
the infamous "Hitchhiker's Guide to the BIOS."

I suspect some of the gripers either are bothered by something
else (like their investment in a system with a dubios future.)

Now I _do_ understand griping about the inability of Atari to
bring the TT to market.

I read an interesting article in "Computer Shopper"
(of all places) regarding this. The claim
was made that the reason that the TT has been sitting in Atari
development since at least early '87 is that backwards compatibility
with 68000 based software has been nearly impossible to accomplish
because of some decisions on how to implement the TOS interface in
the original systems.

In particular, the article claimed that the "Line F" interface
is bogus for 68030 systems. The current versions of TT systems
attempt to run ST software by "patching on the fly" Line F
calls with more normal '030 traps. Needless to say, this has
some problems.

I say scrap the TOS interface and sell a cheap '030 X-windows
Unix (tm) system.

3975. Phantom Typist captured!

Newsgroup: comp.sys.atari.st
Date: 1990-05-01 19:16:14 UTC
From: cjy@uafhcx.uucp
Message-ID: <4173@uafhp.uark.edu>
Source record: 241062

Well, it finally happened. The phantom, which usually hits me about once every three months while using my favorite application, 'uw', struck. The difference is, this time I was using Revolver, the task switching software that allows you to partition your ST into multiple virtual machines. I was able to switch to another VM and save the VM with the phantom in it to disk with Revolver's "rollout" function. Upon returning to VM #1, the phantom was still there; so, I exited to the desktop. As has been reported to the net, the phantom survived exitting the program. I rolled out a new image of VM #1 in that state. (Incidentally, VM #2 showed no signs of the phantom's presence.) Any program I invoked that used gem windows suffered the usual effects, other programs such as Mark William's 'msh' seemed unaffected. Intersect software says that they do not save or restore any of the keyboard settings other than the interrupt vectors, which would seem to indicate that the theory that the problem is in the keyboard is incorrect, since "rolling" in the "infected" partition to a properly performing VM causes the phantom to return.
So, here's a chance for the ST guru's to figure out the cause and cure for the phantom once and for all. Because of the way Revolver works, anyone wishing to work on the phantom would have to have a machine equipped the same as mine. Specifically, TOS 1.4, 4 Meg, and the Revolver software. The reason for the memory requirement is that the VM that the phantom was captured in was a greater than 2 Meg partition.
I will ftp an arc file containing this note, my 'revolver.inf' file, and the phantom-infected roll-out (it's only 250K with Revolver's compression) as 'phantom.arc' in the 'atari/new' directory of 'terminator'.
One final bit of information, my auto folder contained in order :
revolver.prg
revolver.inf
revolver.sys
poolfix3.prg
tos14fix.prg
qstauto.prg - Version 1.46
saver.prg - pyro
timeset.prg - ICD's clock setter - not resident

However, I doubt this is relevent, as I have had the phantom strike under TOS 1.0 with entirely different programs in the auto folder.

Good luck.

How about store the zoo file in a large ramdisk and send the
extracted files to a empty floppy disk. With a 1040st, you should
have plenty of RAM to set up a 400K ramdisk, and if the extracted
files won't fit on a regular disk, there are programs that will use an
extended format and pack more data onto a single disk.

>(414) 524-6809 (home) | 100 NE Ave, Waukesha WI 53186

I don't think `uw` is possible without job control.

Since I sometimes use it at school, I wanted to use it
on co-op, but they had various System V versions
which could not handle pseudo-terminals (`uw` needs pty's).
Without pty's, signals would not work (interupts, stops, etc)
because any SIG would go to every process you're running,
not just the ones in whatever window you're currently using.
Without the ability to create different process groups,
`uw` can't work the way it was intended.

So, a re-write of the tty device drivers and some of Un*x itself
is required for SysV, I think. Has anyone undertaken this?

kruysbergen@hnykun53.bitnet

Re: N_SYSCOM.ACC

I have loaded and tried this program. I have three criticisms:

1. Do not clear the screen at startup. An ACC loads after other programs
in the AUTO folder and I like to see what they have to say.

2. A means to slow the display and/or log the system calls is really needed.
As it is now, there is just a blur. Pretty, but not useful.

3. Did you purposfully scramble the letters in the ASCII strings? It sure
makes simple fixes a pain.

Turtle 3.0 does most of this for you. It has a special tool to handle
large files and does a nice job saving everything.

Recovering lost files:
If this means reload from the backup, Turtle solves this easily.
If this means "oops I just removed it", NORTON PC utilities running under
PC-DITTO is real good.

You don't need to do anything to open the AUX: port, it is already
open. Use Rsconf() to set the baud rate, etc. I use Laser C, so I am not
sure, but I would guess that the Mark William's C manual would have the
parameters listed. If not, send me mail, and I'll tell you what they are.

To see if there is a character ready to be gotten, use Cauxis().

To check for carrier, I use the following routine that I wrote in Laser C:

/*********************************************\
* Carrier Detect routine *
* 1 = carrier present 0 = no carrier *
\*********************************************/

carrier()
{
char *rstat;
int car;
long stack;
stack = Super(0x0L);
rstat = (char *)(0x0fffa01L);
car = 1-(*rstat & 0x02)/2;
Super(stack);
return(car);
}
```

To control DTR I use:

```
/*********************************************\
* Turns DTR on or off *
\*********************************************/

dtr(st)
char st;
{
long p;
if (st == ON)
Offgibit(0xffef);
else
Ongibit(0x10);

3984. Uploading to terminator

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 01:22:31 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990May2.012231.3516@terminator.cc.umich.edu>
Source record: 241071

Howdy folks,
Recently there has been an attempt to create an index of the files at terminator. In order to aide the indexing process in the future, please mail me whenever you upload anything, and let me know what the archive is, what it is supposed to do, who the author is, whether it is shareware or pd, any known bugs, if you like it or not, etc. This should help a lot.
Thanks and have a swell day,
Jmw

3985. 1040ST, SM124's for sale

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 02:00:25 UTC
From: lbert359@pallas.athenanet.com
Message-ID: <339@pallas.athenanet.com>

Cross-posted to: misc.forsale,comp.sys.atari.st

One used Atari 1040ST, excellent condition, $450.
Two *brand new, never been out of the box* SM124 monochrome monitors, $90 each.
One slightly used SM124 monochrome monitor, $70.

You pay for shipping.

3986. Extra memory with PCDITTO2

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 04:15:38 UTC
From: marshall@uqcspe.cs.uq.oz.au
Message-ID: <3465@moondance.cs.uq.oz.au>
Source record: 241074

After much sweat, many tears, a burn-out on the 5V track of the connector board, and the help of an electronics technician, PCDITTO2 has been installed on my 1040ST + TOS1.0 :-(. It works very well (except that it can't get the date fron the ST).
Question: If I upgrade my ST to 2.5Mbytes, will PCDITTO2 be able to use the extra memory?

Gerry Greenberg asks : Should the manual for DC DESKTOP state QUICK ST 1.8 instead of TurboST 1.8. The answer is yes and no. Yes, QUICK ST 1.8 will effectively disable DC DESKTOP, but the newer version QUICK ST 2.0 has been specifically designed to work with DC DESKTOP, and vice versa, DC DESKTOP has been designed to work especially well with QUICK ST 2.0. For those of you that have not updated, I highly recommend it.

As for the demo on the disk, it is version 2.0 demo, not 1.8.

Later, Lawrence Kelley asks: How much memory does it consume?

Answer is: In minimal configuration, between 40-50K. Maximum configuration, without going overboard, and without having a printer spooler, about 90K. Other modules, which can be run from the desktop or installed from the AUTO folder are not included in this figure.

The beauty of the system is that it is modular, and any feature you don't need or desire, doesn't have to be installed.

- mike

Not quite. Atari Germany has taken over distribution of X/ST/windows,
the X server, for the ST. They just stated it would be available in June
1990 in system special shops.

What do you mean by Unix Fortran ??

There is an ISO Fortran standard called Fortran77. In my
experience most Fortran compilers on Unix machines have a close
conformance to this standard.

My knowledge of Fortran compilers for the ST is limited to Prospero's
Fortran77 compiler which is a fully ISO validated. I have experienced no
problems,(when programming within the standard) moving code to and
form my Sun at work.

I think there is another compiler for the ST but cannot remember any
details.

Hope this helps

Chris...

3993. (none)

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 10:24:36 UTC
From: M.A.Holloway@SYSE.SALFORD.AC.UK
Message-ID: <.2.May.90.11
Source record: 241207

Over Easter I attempted to write a mouse pointer animator. I came
across two problems which I hope someone can help me on. Firstly, if I took
the mouse pointer up to the menu bar and started moving it about frantically
from one menu to the next, weird bit patterns replaced some menu entries.
Secondly, when the text window scrolled it left "mouse droppings", ie the
mouse sprite was scrolled up with the text and thus not wiped out by UNDRAW
SPRITE.
At first I thought (2) was a trivial problem, accounted for by my own short-
sightedness (it still may be so, please tell me!). My program was wiping out
the old frame and drawing the new one without knowing if the application was
scrolling or whatever. Now the mouse handler in the VBL queue tests two
conditions before it redraws the mouse:- the byte at $2847 (in my system)
and bit 0 of $2846. As far as I can tell the bit flag is a "has the mouse
moved since the routine last checked it?" and $2847 is a "don't do a redraw
as the o/s is transforming the mouse sprite etc". Is this so? Do
applications set the byte @ $2847 (or L-A variable base - 339) to non-zero
if they want to disable the mouse?
To eliminate the problem I tried testing $2847 and only redrawing if
it was zero, but this failed, why?
On the subject of documentation of the system:Dissassembling the ROM
might well give you a little knowledge, and this CAN be "dangerous", as one
can find out half of what a system variable is and assume that s/he knows the
whole story of it's uses=> incompatibility with some programs. Atari could
prevent this by providing the official documentation reasonably priced.
Atari would be the overall winner:-more money (I'm sure Abacus have made money
on their incomplete and sometimes inaccurate BUT AVAILABLE system books) and
more programmers who can find out cheaply how to program "legally"
(the little guys who write for PD/shareware are just as
important as the software houses which can afford the developers package).

3994. Re-using a Megafile

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 10:48:59 UTC
From: MALCOLM@tower-vax.city-poly.ac.UK
Message-ID: <9005030701.AA17821@ucbvax.Berkeley.EDU>
Source record: 241208

I have an Atari Megafile hard drive which I want to use with a non-Atari system equipped with a SCSI interface. Since my knowledge of the hardware technicalities of hard disks is fairly scant, I'm going to air my ignorance here in the hope that I can learn something.

The drive is a Megafile 30, using a Seagate ST238R. The controller board is rev 2.1 and is labelled 'RLL with SSI'.

1. RLL is a means of formatting a disk to obtain more space at a slight time penalty, isn't it? Is it a modulation technique (like MFM)? Can it be used with any drive?

2. My understanding is that a hard drive for the Atari ST needs three things: a host adaptor (which converts the ST DMA interface to SCSI), a disk controller card (various Omti and Adaptec part numbers are bandied about), and the drive itself. The controller card can be omitted when the drive has embedded SCSI. If I've got this right, it seems that the 'controller' board in the Megafile combines the first two functions. I'll need to bypass the host adaptor part. Any tips?

3. 30MB isn't much, and the ST238R isn't fast, so at some point in the future I'll probably want to swap it for a bigger/faster unit (or add a second drive). What will I need to know when choosing which drive to buy?

4. Am I wasting my time? Would it be cheaper to sell the Megafile intact and buy a drive with embedded SCSI? (I already have various PSUs lying around).

Thanks in advance,
Malcolm

3996. STE investigation/ docs discussion [large!]

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 11:34:00 UTC
From: J.Derrick@newcastle.ac.uk
Message-ID: <1990May2.113400.1884@newcastle.ac.uk>
Source record: 241098

[this message is a bit big- contains some discussion then my STE hardware findings]

Whew! I've been away from the net for a bit due to work and machine problems, so I've only just caught up with the discussion about the STE and documentation for its new features. Here's my opinions:

- I agree totally with Allan Pratt that blindly dissasembling the ROMS and using what you find blatently will result in hack code that is very likely to be incompatible with anything apart from the machine it came from [remember all the 1.09 stuff]. I therefore never intend to pass on shaky information such as ROM vectors [very likely to change], and TOS specifics [where I just don't know enough to comment]. I also don't want to wander into a copyright minefield.

- I also agree totally that what is needed is *official data*. I would dearly love to become a developer and burn my copy of INTERNALS. Unfortunately I can't. [note I'm under Atari UK, not America]. To give credit where its due, over there Atari appears to be improving its support to earn its cash more. However, in the UK it costs 300 pounds [$500] to become a developer. I'm a student- that represents my grant for a whole term! It would take Devpac 2 and Lattice C v5 to be bundled before I could even begin to justify that sort of cost for support- all I really need is docs, I'm not a company!

- I received 6 A4 sheets extra manual with my STE. I think that is unreasonable considering the changes from the ST. Okay, I got it for a bargain 260 pounds pre-release [$400]- I don't know the current situation, but there are _NO_ other docs avaliable. No Atari stuff, no third party stuff yet. I have been forced to hack. I am a software engineering student- I hate hacking; I want accurate docs, not hearsay. My thanks go to Mathew Lodge who has done a great deal to spread 'good', 'accurate' information. My pleas go to Atari for docs only, say <100 pounds [$160]- I can afford that, and still should be profitable for you.

- Thanks are due to Allan Pratt for keeping up with these discssions and replying from an 'insiders' viewpoint [I hope that says what I mean]. Due to differing intrests your messages are some of the most debated, but I hope this is taken as a complement. Your time and opinions are definately valued here.

With these topics firmly in mind, and armed with Mathew Lodge's posting I've updated my findings, and include them here. Thanks to all who wrote and expressed an intrest- sorry for the delay- troff'ing a thesis/exams and system problems are keeping me busy!

I also have a _very_ simple test prog which displays the port values, which if I can work out how/get time may get posted to binaries.

--------------------------------axe murder here--------------------------------

STE Joysticks/ROM

Please note this information is largely derived from my own findings, and is not backed up with hard Atari fact. I accept no responsibility for errors or omissions, and give the warning that serious damage could result from experimentation. Please don't blame me if your STE shorts out and expires! All details could be fatally flawed and subject to change in the future causing compatibility problems- please use only for personal experimentation and not full program devlopment. I include specifics for general information only. My opinions of disclaimers are my own.

The only data Atari gives for the new connectors is the plug signals contained in the single sheet STE addendum, thus my only way forward was to look in the ROM.

Looking at the system variable _sysbase [$4F2.L], the STE rom appears to have moved down to $E00000, which is bourne out by the exception vectors. My dissasembler would not look at this area, so I wrote a 68K routine to go into supervisor mode and dump the memory to disk. This uses GEMDOS Fwrite to save the rom a long word at a time. This is very inefficient, but it didn't like saving large chunks [I'm new to 68K on the STE, so there's doubtlessly a better way].

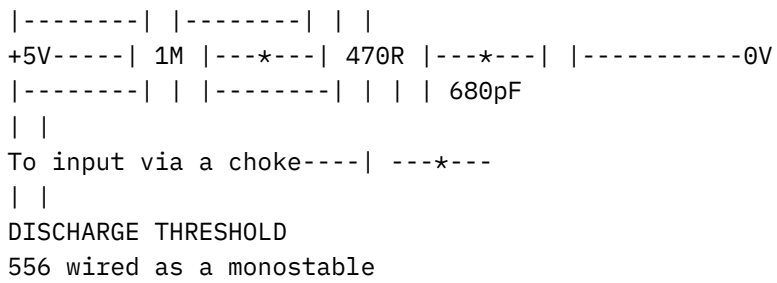
From this, the rom data lies in the range $E00000-$E31B48. My UK TOS 1.6 is on 2 EPROMS, both apparently 27C010-250, with the upper space empty. Looking through the code, it resembles the dissasembly in ST Internals, but with many improvements and additions for the new hardware.

The BIOS and XBIOS trap handlers appear much the same as before, but there seems to be an extra XBIOS call $40. This seems to look at $FF8A00, and check for a bus error. Its purpose is unknown.

Going through the initialsation stuff, the code is also mostly as before. Memory clearence is now faster, with a few extra writes in the loop. To support the new hardware, code has been added, notably around $E002C4. The DMA sound is initialised [$FF8900] and the tone control acessed via the microwire bus [$FF8922,4]. There seem to be a number of new system variables, for instanve look at $980 onwards. These locations come complete with text names: _VDO, _MCH, SND, _SWI. _SND is set up according to $FF9200, which after a bit of experimentation turned out to be the new joystick ports. Again this is for information only- their pupose is unknown.

Inside the STE, the joystick ports are 3 74LS244 octal buffers, 1 74LS373 octal latch, and 2 NE556 dual timers. From the addendum, the ports give 4 switched sticks and 2 analog proportional sticks, or 4 paddles. I can't wait for the flight simulators complete with a proper yoke, although things like temperature measurement should be posible [watch this space!].

The timers form a simple ADC, wired as a monostable and connected to the new GLUE chip [? this is a bit uncertain without data]. They seem to be a voltage to frequency converter. I traced this much:



By varying the input, the duration of the timers pulse can be altered. If this was measured by a counter after a RESET or TRIGGER, the position of the stick could be determined. From Matthew Lodge's data they end up as a byte value in the following locations:

Paddle 0X $FF9211 [all byte values]
Paddle 0Y $FF9213
Paddle 1X $FF9215
Paddle 1Y $FF9217

After some experimentation, their detail is still sketchy. They float unconnected at around $80 [half range?] suggesting 0-255. Using a 100k pot connected to +5 and 0V varying the input voltage, strange results are obtained. From 5V to about 3.5V the value rises from around $05-$40. Below this the ports are not updated and contain garbage. Around this point the pot DC voltage mysteriously goes low- try a scope to see the 555 oscillations?

By using current drive instead of voltage [connect a pot between +5V and the input] more meaningful results are gained. With a 100K pot the value varied in a log manner $05-$15. With the right value pot this may be the correct usage. Anyone have paddles for a CBM64 or 8bit Atari to look back and check?

The digital standard stick inputs are a little simpler. Four sets of FIRE, UP, DOWN, LEFT, RIGHT give 20 lines. These are arranged as 12 inputs and 8 bidirectional lines. Matthew Lodge suggests all lines are bidirectional, but this may be misleading- the chips suggest 24 inputs and 8 outputs, which fits with what I have found. This arrangement allows far more than just a simple switched joystick to be connected- 6 inputs, 4 outputs and 2 analogue lines per connector.

A quick note on the plug: the STE uses a special D connector, with 15 lines encased in a standard 9-way sized shell. These are fairly new, but a few firms list them [check stocks though- try Electrovalue (0784) 433603, part no. DP15HD, or Verospeed (UK firms)]. You want a 15 way high-density male D-plug and a standard 9-way hood [optional cover]. Unfortunately the case design means that the side lugs need to be hacksawed off to fit- solder the sawed plug housing together, and glue/file the hood to shape [try it- you'll understand!].

Solid core wire will fit the holes for experimentation, but use thin stuff to avoid damaging the sockets. This method is also prone to shorts and errors!

The ports appear to be arranged as follows:

```
$FF9201 [READ] $FF9202 [READ] $FF9203 [R/W]
-------------- -------------- -------------
B0 - FIRE 0 B0 - RT 2 B0 - RT 0
B1 - FIRE 2 B1 - LT 2 B1 - LT 0
B1 - FIRE 1 B2 - DN 2 B2 - DN 0
B3 - FIRE 3 B3 - UP 2 B3 - UP 0
B4 - ? B4 - RT 3 B4 - RT 1
B5 - ? B5 - LT 3 B5 - LT 1
B6 - ? B6 - DN 3 B6 - DN 1
B7 - ? B7 - UP 3 B7 - UP 1
```

$FF9203 can be read as the other ports, but if it is written to, the '373 latch kicks in to action, and those 8 connections become outputs. If a read is subsequently performed, the lines become inputs again, although it may take 2 tries to get valid data from the port [the first reads the output states, then switches them to inputs for the next attempt].

I have not tried fitting a light pen/gun, but the input seems to be FIRE0. A logic pulser applied here alters the position registers at $FF9220 and $F9222. I've used a photodiode and amp or a sweet spot device [all in one] for other machines [BBC micro & CBM64] so this may be the correct method. Dig up those old video game light guns! [Make certain you know what you are doing though- they will require hardware mods!]

If you take the STE apart, be wary of the SIMMS- mine died with vertical lines on the screen due to a bank of RAM loosening after flexing the board. A bit of gentle pressure on all the socketed compolents fixed things, with an almighty sigh of relief! This also caused a problem when upgrading to 1M. Cut thin pieces of cardboard to fit in the keyboard side of the SIMM holders to gently push them forward and prevent wobbles [any one remember the ZX81 (TIMEX 1000)!] Also REMEMBER TO TAKE STATIC PRECAUTIONS. If you don't know what/why don't do it!

On the whole the STE seems very well designed, and a definate credit to ATARI. I like the hardware [the colours and the new ports are well designed], and the new TOS seems to have a few extras in addition to the obvious [I love the left mouse button for scrolling up text]. What a pity the documentation isn't out yet.

Yes, I know my STE is pre-relese [260, proposed relese price 399], but I'm dying for some data, and just can't afford 300 pounds to become a developer. Are there any _good_ books out there? [what are the Compute series like?] I'd kill for a circuit diagram! Mathew Lodge has done a great job publishing what he can, dispelling a few rumours, and helping STE programmers be more accurate.

Share and Enjoy,

James Derrick.

I'm not sure what gwg means by a Unix standard, but Fortran-77 is described by a standard document ANSI X3.9-1978. Unix f77 includes some extensions as documented in a 1978 paper by Feldman & Weinberger. Since f77 is closely linked to C, non-Unix compilers generally do not share the C-like extensions.

Both the Absoft and Prospero compilers appear to be full Fortran-77 implementations.

Source record: 241089

I was not at the Pittsburg show, since I was pretty busy with the meeting we had here in Rochester the same weekend. When I called Bob Brodie yesterday, he said I ought to read the string on GEnie regarding PACE show. As much as I'd like to "reprint" many of the messages following Bob's (included below), I don't think GEnie would be too happy (I'm not even sure if I'm supposed to include this one :-).

>>> Please note that the "group in question" in paragraph 1 is NOT PACE. <<<

Bruce Nelson President, Atari Computer Owners of Rochester (ACORN)

Category 11, Topic 11
Message 95 Mon Apr 30, 1990
BOB-BRODIE [Atari Corp.] at 19:21 EDT

Jeff,

The group in question did not have a booth. They did have members present at the show, I am told. What was incredible was the blatant way they discussed their practices *RIGHT IN FRONT OF THE DEVELOPERS*!!!!! They had an obvious affect on the sales of software at this show. GRIBNIF sold about 1/10th of what they usually do. An example: someone bought a new paint program at the show from one of the software companies. About 45 minutes after making the purchase, he brought it back, requesting his money back. The vendor was surprised, as he gave an excellent price on the product, and it was still shrink wrapped. The explanation was that he wanted to return it because "his friend knew where he could get one for free."

As far a future show for that area, good luck. I can't go to Atari and recommend that we go back to that area. Word reached me before I got to the show about what was going on, and I was angry when I got there. Angry because this developers are my personal friends, angry because there are complaints about Atari not having a dealer (and now we know why!), and angry that the people at the show would be so cavalier in their attitude toward the developers.

We all have to fight this type of activity any way we can. Here's what I did: I had gotten approved a very nice selection of door prizes for this show, a MegaFile 60, six sets of TOS 1.4, Gaunlet for the Lynx, Airball for the eight bit, AtariWriter 80 and an XEP-80. Quite similar to what I did for the MidWest Swapfest, except it was a 60 Meg HD instead of a 44 Meg removable. When I heard what was going on in that show, I decided to return all of the prizes to Sunnyvale. It is a shame, as perhaps some legitimate user might have won a nice door prize. But from what I saw, we just would have helped the wrong people out. So, all of the product came home with me, over $1000 worth of doorprizes. I'm not going to go to Atari and ask them to support a

group/show that doesn't support the developers and dealers that show up to support them. It just isn't right.

BTW, I was in Rochester the day before, and I did give away everything to them that I planned to. They got the same prizes that I had planned to give at the PACE Show.

4000. FAT problems gone

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 13:45:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9005021247.AA02075@Sunburn.Stanford.EDU>
Source record: 241212

The problems I described a while ago with a mega 2 with dutch TOS 1.4 ROMs
which did not treat the FAT sectors correctly are solved.

- The ROMs were exchanged with UK 1.4 ROMs (which are available in Holland!!).
- Both the DMA and the MMU chip were exchanged.

I don't know what solved the problem.

4004. QUestions, questions questions

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 15:05:47 UTC
From: ins_bac@jhunix.HCF.JHU.EDU
Message-ID: <5122@jhunix.HCF.JHU.EDU>
Source record: 241091

I have a few questions that hopefully people here can answer.

1) Does anybody know the status of the 68030 board being prototyped
by Jim Allen and Dave Small. Ok if you do know, what exactly is the status
of it? Will it be in the market at a reasonable price?? I know he is
bringing it to the Boston Atari User Group Meeting at MIT on May 8th.

2) I guess I'm a sucker for rumors, but what are the details about Atari
Germany DEMANDING the TT or action on the TT. From what I have heard there
already is a publication in Germany about to start dedicated to the TT.

3) Why does Atari really hurt their dealers by selling them Lynx's at >160
dollars when Sears is selling them at 159.00

4) Does anybody know if its possible to purchase a 4 meg STe in the United States

5) Has Wordup 3.0 arrived yet????

thanks to all
-Ajay

4005. Mixing C and Assembly

>Does anyone know: (1) If there is a standard (unix) for Fortran?
> (2) If there is an ST compiler which compiles unix fortran?
>
>Garret Gengler

The current standard is the ANSI Fortran 77 version. The document describing
this is ANSI X3.9-1978. This is NOT a standard for Unix but a standard for
everyone. Unix compilers *should* follow this standard. The Prospero compiler
for the ST may be Fortran 77 compilant, if not it should be quite close.

There is a new ANSI standard called Fortran 90 (ANSI X3J3) which is not quite
out yet. This is the result of a *large* amount of work and is much larger than
Fortran 77. There are no compilers for Fortran 90 at present.

4008. Difference in ST & MSDOS Disk Format

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 17:52:18 UTC
From: iadt3tb@prism.gatech.EDU
Message-ID: <8818@hydra.gatech.EDU>
Source record: 241095

So what is the critical difference between Atari and IBM boot records?
Where (what bytes) is the serial number that Atari puts on the disk and
what is the correct format for it? What is not in the Atari boot sector
that is required for MSDOS to be able to read and write to the disk
successfully?
Does anyone have a text file containing this and other associated information
that they can send me (or tell me where I can get it via FTP)?
Thanks for any and all help and pointers.

Terry

4009. Re: Phantom Typist and Atari's Responsibility

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 18:10:23 UTC
From: dag@persoft.com
Message-ID: <1990May2.181023.7693@persoft.com>
Source record: 241201

I have not seen the Phantom Typist(tm) recently, but the circumstances surrounding the times that I have seen this phenominon along with assertions that this has manifested itself while Spectre is running lead me to the conclusion that the problem lies not in TOS but in the IKBD firmware and the protocol which communicates between the two subsystems (the motherboard and the IKBD).

Locator, joystick and keyboard messages all pass from the keyboard processor to the CPU using a protocol which is prone to problems if the CPU loses any characters due to interrupt latency problems. If a single character is lost from a mouse packet, the next byte sent by the ikbd is interpreted as the last byte of the mouse packet. If that byte was the first byte of another mouse packet, the remainder of the packet is likely to be treated as a sequence of odd keypresses (depending on the values in the bytes.) I've seen this happen where a stream of some character started comming from the keyboard because some mouse packet characters were treated as key-down events and no corresponding key-up event was detected. (Auto-repeat is done in software.)

I've not gone back and looked at the TOS handling of key rollover, but this may be the cause of part of the problem. This is the TOS/Application side of the protocol.

On the IKBD firmware side, I've seen problems occur where a circular buffer full or overflow condition causes some very odd behavior in emptying the buffer, ie. the condition is never properly cleared and the buffer handling code keeps looping through the buffer sending nulls (or garbage) plus one new character per loop through the buffer. The folks at Atari may wish to look into the ikbd firmware and verify the buffering strategy (if any) therein.

>inside these files.

You should also get the README file in the Gnu directories. As explained there, the files 1-13 are not independent zoo archives, but parts of a single archive. It's split to make it easier to transfer (so if your transfer dies, you don't need to grab the whole multi-megabyte file again, you just need to get the specific parts that got messed up.) To extract the files, you need to concatenate all the parts together, and run zoo on the combination.

4011. Fading SM124 inverse video

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 18:29:20 UTC
From: idh@NABLA.ELECTRICAL-ENGINEERING.UMIST.AC.UK
Message-ID: <9005021929.a001575@nabla.electrical-engineering.umist.ac.uk>
Source record: 241217

My thanks to those who replied to my posting on the subject of dimming SM124 white characters on black background; It appears lots of people have had this problem but no one knows the solution. Suprisingly, Atari UK claim to know nothing of this 'feature' of their monitor. The phenomenon seems limited to 'heavy' SM124 models that use a large mains transformer, later versions using a light switched mode PSU are not affected, neither are SM125 monitors. A service man (Charles) fom Silica shop seemed more helpful, and said he would investigate the problem if he could reproduce it on his SM124. Since the Germans seem to be the best ST hardware hackers around perhaps a German reader of this BBS may have read of this and be able to shed light on the topic.

This isn't exactly the clearest of questions. The Mark Williams package comes with an assembler, what else do you need? The entire Mark Williams software suite is pretty closely modeled after a Unix programming environment, and all the tools reflect that orientation. In particular, the object file format used by their compiler, assembler, and linker is a proprietary format, and not what you get out of the DRI assembler. Also, the syntax used in the assembler is pretty much the same as you'll see on a Unix system.

If what you're really asking is "does MWC let you use inline assembly code in your C source files" the answer is no. But it's a simple matter to pull out the inline code and assemble it separately using their assembler.

4014. Supercharger problems

Newsgroup: comp.sys.atari.st
Date: 1990-05-02 20:28:04 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <3308@calvin.cs.mcgill.ca>
Source record: 241099

Here is a sequel to my original article, now that I have a bit more
information. It is basically a point-by-point breakdown of my
impressions on the package.

Problems:

1] Hercules graphics mode is a little screwy.
I try it on my mono monitor and about one inch of the screen's image
is cut off at the right of the screen. If anyone else experiences
this, send me mail. I am really concerned about this bug.

CGA works fine, so I can still do graphics on most programs,
such as WP with its equation editor.

2] The built-in font is not very pretty. They should've just used the
system font.

3] The power cord which plugs into the joystick is a stupid idea. I bought
a transformer. Which is required for STs with more than 1 mb of memory
(and since I have one, I had no choice).

4] The Supra Clock reader program (and others, so I am told) will bomb
while running unless the reset button on the Supercharger is held down.
This means that supra users can't re-enter into IBM mode unless
they disable the clock., because the hotkey which exits
out of ms-dos mode reboots the ST.
This also means that the reset key must be held
down every time you boot up the ST (if you want the clock) which
is also a pain.

5] Print spoolers interfere with the MS-Dos printing, so these must
be disabled before running supercharger.

good points :

1] Factory setup of software and hardware automatically scans for all
physical and logical drives, and installs them for you, and the
ibm's clock is set to the same time as the ST's clock.

2] ST disks can be read without any problems. The ST's mouse can emulate
an MS - Mouse.

> the files came through with the corre.

>
> I've tried zoo on the ST and also a PC at work although the PC version is only
> 1.31.

You have to concatenate those files to form ONE SINGLE zoo file
first, then un-zoo them. They are just split into (otherwise
meaningless) pieces. To completely install gcc, you also have to
ftp some files from terminator (such as include.zoo etc.).

BTW : take care what zoo makes out of your filenames. I spent a
couple of hours trying to figure out why my hello.c program would not
compile, until I found that the zoo version I use transfers hyphens
in filenames into underscores while unpacking, so gcc was looking for
gcc-cpp.ttp instead of gcc_cpp.ttp which I had on my disk...

Also make sure that handle 2 is directed to the screen, otherwise you
are going to be very confused when compilation of a program aborts
without error messages appear (at least I was). In Mupfel/Gemini, the
best way of doing so is to include the line

set errorfile con:

in MUPFEL.MUP .

> Does anyone know: (1) If there is a standard (unix) for Fortran?
Yes, there is a standard. It is
ANSI X3.9 - 1978
Programming language FORTRAN
American National Standards Institute, New York. 1978.

It defines the language commonly known as FORTRAN 77. However, most
unix machines have their little deviations from this standard, such
as allowing a line to be longer than 72 characters (punching cards,
anyone?), allowing lower case keywords, allowing recursion, allowing
identifiers to be longer than 6 characters etc. Depending on any of
these 'unix features' will make your program non-portable, and you
would give up the only real advantage that FORTRAN has over most
other programming languages: it is PORTABLE. So, ANSI FORTRAN is
definitely the thing to go for if you go for FORTRAN at all.

> (2) If there is an ST compiler which compiles unix fortran?
There are two FORTRAN compilers for the ST which come to my mind
right now:

Prospero FORTRAN (said to be slow, full ANSI standard)
Absoft FORTRAN (don't know much about that one).

I use Assempro from Abacus and MWC together. I compile the
Assempro source code into PC-relocatable form with a header at the
beginning containing the addresses of each routine. Then, I run a MWC
program that converts the object file into MWC format. I am then able
to link these files and MWC object files together. Unless you planning
on doing some heavy duty assembly language programming, I suggest you
stick to the MWC assembler. The only nice thing Assempro offers
is macros. By the way, I had to create the conversion program myself.

Re: Pittsburgh Show--Article Retraction.

Flame War Watchers:

I have CANCELLED the previous POST "...gets Brodie pissed" out
of a desire to remain NEUTRAL in the "Pittsburgh-Controversy".

After speaking with several individuals involved in the whole mess,
I have decided of my own free will to CANCEL the abovementioned POST
and have changed my signature to reflect a neutral additude.

While I still remain a member of the Atari Elite, I am
NEUTRAL when it comes to a heated controversey like this.

Fellow ST DEVELOPERS--I think you know my partial justification
for remaining neutral--especially if you were at the AtariFest on Sunday,
April 29 in Pittsburgh.

I have NOW heard BOTH sides of the story and feel that it is
in my own personal best interest to NEITHER CONDONE NOR CONDEMN anyone
for the events of Saturday and Sunday.

I am NOT a spokesman for the A.E.; This is ONE reason the
previous post has been cancelled. I initially posted (with permission)
out of anger---and without thinking about the implications.

I ask you, fellow netters and developers, to consider me
NEUTRAL and not a sounding board for anyones gripes.....

I will be "listening", but will refrain from acting as a
middle-man for either faction.

How's that for a disclaimer??? :-)

[rest of the 4-letter words deleted]

Maybe so, but how many of these "other groups" have a lending library
of COMMERCIAL software for their "members"?

Bob was in Rochester that Saturday. To me, it looked like it would take
ALOT to get him angry. He's a nice guy, and very down to earth.

No, I was not at the PACE show (I have to do my homework SOMETIME).
But if you have such a commercial lending library, and if you were
openly talking about it at the meeting, then I have absolutly no
sympathy for you. I'm an officer in a user group, so I know how things
SHOULD work. Having a commercial library is like saying "I BORROW
hubcaps off of other people's cars because they don't NEED them".
Plain and simple: PIRACY SUCKS. If you guys practice it, I hope you
get nailed to the wall. I can't see how "cross-town rivals" could cause
such a furor if both PACE and AE are on an equal (re: non-piracy)
footing. The fact that you used so many 4-letter words seems, at least
to me, that you're awfully defensive. I wonder why.....

Well, my silly sibling has rebelled and decided to get a 386 machine
instead (tried to talk her out of it...HONEST!). Now, I am stuck with
my ST. I'd like to find out what it is worth so I can sell it. It is:

a 3 year old 1040ST
2.5 meg RAM (EZ-RAM) upgrade
Internal fan (added by moi)
color monitor
old-style (extra crisp) mono monitor
bunches of original games, programs, etc.
original boxes, docs, etc.

If anyone could be so kind as to email me with the latest street prices
of this stuff, I'd be much obliged.

(OK, I guess you're dying to know what machine will be replacing my old
ST, right?) Well, it is....

Hit n now if you don't want to know... :-)

An Amiga 3000 25mhz 68030 workstation! Yippee!

And now back to our regular programming....

Chris

>
>If what you're really asking is "does MWC let you use inline assembly code
>in your C source files" the answer is no. But it's a simple matter to pull
>out the inline code and assemble it separately using their assembler.

from experience here at electrohome, i'd say that Mark Williams C
has probably the most rediculous, non standard, brain dead, stupid assembler
i've ever seen for the MC68000. nothing in it makes any sense, like how
to make a register list, the naming conventions for labels, etc. also,
why the hell are comments started with a bloody '/' character??? it makes
porting of assembly files a REAL hassle. like Howard says, the object
file format is completely proprietary, so you can't use a world class
assembler such as MadMac (in the atari devkit) with the MWC environment.
blech! :-(

we've switch over to Manx C for internal development on the Atari, and
i have to admit that it is probably one of the best environments you
can get for the Atari ST. it comes with a NORMAL assembler, the compiler
generates reasonably efficient code, and it supports a number of code
models which my other favorite, Laser C, doesn't yet.

i think i've gotten off topic ... hope this all helps!

Cross-posted to: comp.sys.atari.st,comp.sys.amiga

First - Congratulations on moving on from your Macintoy.
Second - The gents at Commodore say Unix is on the way soon, probably worth hanging in there for an amiga with Unix. AMiga's are much more expandable than ST's and will serve you better down the line. The 68030 is readily available for the amiga.
Third - I know people who have gotten educational discounts on amiga's don't as me from where though.

Later.
-KOT

4027. Re: OS9/68K

Newsgroup: comp.sys.atari.st
Date: 1990-05-03 06:42:47 UTC
From: marc@wopr.UUCP
Message-ID: <39@wopr.UUCP>
Source record: 241234

D.Wade@sysd.salford.ac.UK writes:

> I too would like to try OS9/68K but in the U.K. the cost of it is slightly
>more than I paid for my STE512 and Phillips PM8833 monitor ....

OS-9/68K isn't that cheap (about 1500 Swiss Francs), but compare with any
other OS available for the ST:

- real-time
- multi-tasking
- multi-user capalities
- C development package
- Sculptor 4-th generation database
- Spread sheet and Wordprocessor
- A whole bunch of utilities
- UUCP and many other software packages are PD and absolutely free!

So it's definitely worth its price - I think it's better to pay for it
than to get a buggy and malfunctional so-called operating system like
TOS intends to be...

>on my personall shopping list. I guess those who use it either work for
>the authors and don't pay, or use it for commercial use.

In Switzerland there are many OS-9 Users which don't use it for commercial
purposes but just because of the many nice features.

>of this stuff, I'd be much obliged.

Well, I've heard statements directly from knowlegdeable people on Usenet that Atari's financial position is bleak, and Atari is probably going to go out of business soon! You should probably offer the whole set for $10 or so, to get rid of it before you have to pay someone to haul it away.

(Sorry, I couldn't resist :)

Well, I've been doing more work with DCDesktop and I have
found that it doesn't work with the screensaver accessory
strstrk. Strstrk causes the disk to reboot when loading.
With strstrk disabled, the same floppy will boot the system.
Other accs, such as stuffer and ramit (which are from DC) work
fine.
Mike, any screensavers you know of that work with the desktop?
Also, should it make any difference if an acc is loaded upon
bootup as opposed to being loaded with stuffer? I just
thought of this now, and I'm not at my ST.

> it careful. I had that problem for several months until I had to recognise,
> that the mouse keys did not work and the pointer moves only in one direction.

> Knut Grunwald

Yes, that is a common problem, but it's not the phantom typist.
Wesley Kaplan mentions that it happens with rushed keyboard input,
especially with lots of deletions. The same thing happened to me in
the exact same situation with Tempus II under Neodesk 2.03 and
including Turbo ST 1.6. An awful lot of the original system was
replaced with that software running. As was stated here on the net
before, the problem is relatively high up in the Tos - Gem software
hierarchy and possibly includes a problem with the IKBD processor
firmware. I have the crash dump (it happened shortly after I
verified that I had finally seen the elusive typist) that Neodesk
provided and will post the thing when I remember to bring it in to
work. Hope you ST wizards can make something of it.

Bob Pegram (Internet: pegram@griffin.uvm.edu)

I more or less agree. The stream of documentation hasn't always been steady but in the last six months or so it has been great. And it's more than just docs that's getting to developers now. Disks containing lists of end users, dealers, and press sources are becoming available. Very useful programs are being sent out. Discounts for Atari hardware and software are being offerred to developers. The softsource (or whatever) program atari is kicking off will be a great advantage for developers.

I thank Atari for their developer support.

Dave,

I have been told that you can use The DCPort with RTX, but I need to
know how. I don't want to invest alot of time developing a package without
know how to do this.

Thanks,

4041. DCDESKTOP and ACCs

Newsgroup: comp.sys.atari.st
Date: 1990-05-04 00:31:52 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3186@rodan.acs.syr.edu>
Source record: 241233

Well, earlier I stated that strstrk didn't work with dcdesktop
and wondered whether or not an acc that caused dcdesktop not
to boot could be added to the acc list later using DC's
Stuffer---well, in fact it can! While listing strstrk on my
disk with an .acc extender caused an infinite reboot, I was
able to change the extender to .acx, have it not interfere
with the system boot, and then install it via DC Stuffer...and
it works.
Good going guys!

4042. GFA basic 3.0 and compiler date$ format -- solved!

Newsgroup: comp.sys.atari.st
Date: 1990-05-04 04:07:46 UTC
From: logajan@ns.network.com
Message-ID: <1990May4.040746.21569@ns.network.com>
Source record: 241235

Boy, is my face red! For months I've been laboring under the impression
that the GFA Basic 3.0 interpreter and compiler produced incompatible
Date$ formats (05/03/1990 vs 03.05.1990). Well actually, they do, but
it isn't really a bug so much as a different default which can easily
be corrected!!!

To get the 05/03/1990 date$ to appear in both the intepreter AND
compiler, simpy insert a MODE 1 command. See the MODE command in
the manual for more discussion.

Blush.

I recently acquired a USED 1040ST, with WordWriter and a Panasonic KX-P1091.
I tried printing a test WordWriter file with superscript, etc. in NLQ mode.
I don't have docs for the printer, and I can't seem to find anything in the
WordWriter manual to help me. Can I do bold, and super/subscript in
the Panasonic's NLQ mode? (p.s. it works with draft mode.)

Thanks in advance, netters. ALSO, PLEASE MAIL ME YOUR ANSWERS, I DON'T

```

Obviously what they did was just to map the Hercules screen to the ST. Since Herc expects 720x348 pixels, you will lose some at the edge. The fact that you have a strip at the bottom which isn't used at all is probably not much consolation.

Gerry -

My favorite screen saver (which I used since day one) is IDLE 1.2 by Moshe Braner (one of the best PD programmers alive for the ST!)

As far as I know, if it behaves well inside STuffer, then it runs the same as if were running as a normal DA.

Looks like I'll need to setup STuffer again on my hard disk... Ran out of space for DAs on it...

4049. ICD Hard disks

Newsgroup: comp.sys.atari.st
Date: 1990-05-04 07:35:32 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGRCDDJBDVNT.at.UMPA>
Source record: 241106

I've just purchased a ICD based hard disk from Third Coast Technolgies -
a copy who I would not recommend. Their customer service is one of the
worst I've seen. Still back to the hard disk questions.
i) does anyone know of any documents, books, whatever on hard disks ?
ii) I have a Triangle hard disk and would like to install it in the
ICD one. I was told by TCT that this should be possible. I would need
their cable kit, which I bought. No surprisingly there are no instructions
about how to do this. Can anyone help as I know little (OK nothing)
about hard disks.

Thanks
Steve C.

4050. Uniterm

Newsgroup: comp.sys.atari.st
Date: 1990-05-04 07:42:44 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGRCDDJBDVRV.at.UMPA>
Source record: 241107

I've been using Uniterm for a long time now and am really impressed.
Its a great program. I've just started to use the function key macros
and one thing has me bemused. I can't have the % symbol in the macro
string. If there is a %, it and the remainder of the string after it
are not printed ie.
my string send info-atari16@edu.stanford.score@earn-relay comes out
as send info-atari16
Any help appreciated.

4051. Diablo 630 emulator for SLM804

Newsgroup: comp.sys.atari.st
Date: 1990-05-04 07:47:16 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGRCDDJBDVTQ.at.UMPA>
Source record: 241108

Does anyone have the instructions for this emulator. I got it when
I bought my SLM804 and sort of got it working but there are some
weird things about it. Why can you create a config. with more then
one printer font in it when you can only use the first font in the
config. list - perhaps its possible to change font (which would be
very nice). Does anyone know anything about this?
While I'm asking for documentation does anyone have any on the SLM
itself? I'd be really interested in knowing how to control the beast.

>OS-9/68K isn't that cheap (about 1500 Swiss Francs), but compare with any
>other OS available for the ST:
>- real-time
>- multi-tasking
>...
And OS9 is "easily" extendible to integrate Networks, CD-Rom, Interprocess-
communication (Sockets), other disk formats and so on, without hacking the
kernel and getting a lot of incompatibilities between programs.
There are indeed some of these extensions.
>So it's definitely worth its price - I think it's better to pay for it
>...
>>on my personall shopping list. I guess those who use it either work for
>>the authors and don't pay, or use it for commercial use.
>In Switzerland there are many OS-9 Users which don't use it for commercial
>purposes but just because of the many nice features.
Here in Karlsruhe there are some Users too. If you use OS9 for some time, you
get used to the features. Then is programming or working under TOS just awful.
Playing games is fine, but if you have a long printout of i.e. Signum you
think: "If this could be done in background.". Or the possibility to switch
to another virtual terminal just in the middle of some text or database
processing and look up some data or format a disk.
I do all my "serious" work with OS9, because it is designed to work with it
and not to have a graphical user interface and nothing else.

The drawback of OS9 is of course the price, but on the long run you can switch
to bigger machines and other manufactures, which you can't do with TOS.

My name isn't Mike (my father's was), but I have found PYRO to be the
most reliable screensaver yet. It always works, whether with the
desktop, a GEM program, or a CLI (or Gemini, etc.), and I haven't had
any problems that seem remotely connected to it. I've used it with TOS
1.0 and 1.4 by the way.

All Fortran's have some extensions. They rarely cause problems if you write your code according to the standard. So this means that you can buy a compiler that has extensions (in fact, you almost have to!), but don't use them if you want portability.

The issue of portability is currently being discussed in comp.lang.fortran, so you should read that group if the issue concerns you.

>> (2) If there is an ST compiler which compiles unix fortran?
>There are two FORTRAN compilers for the ST which come to my mind

>
>Prospero FORTRAN (said to be slow, full ANSI standard)
>Absoft FORTRAN (don't know much about that one).

I have been using Absoft and it appears to be a full implementation. It also supports GEM through the use of a reasonable set of extensions (they have a special subroutine for the interface to non-Fortran features).

>porting of assembly files a REAL hassle. like Howard says, the object
>file format is completely proprietary, so you can't use a world class
>assembler such as MadMac (in the atari devkit) with the MWC environment.

I was a bit surprised to read this. While I haven't used it, I know that
MadMac has a switch for writing MWC compatible output. That should
eliminate most of the problems quite quickly.

I have to agree with the complaints about the MWC "as" syntax, but I
do understand the reasons. Their documentation states that the syntax
of their compilers and assemblers is common across all development
platforms. So, while it may be bizarre for any one specific machine, it
maintains the same standards for all. The '/' comment deliniator is an
obvious carryover from C syntax. Most of the assembler is designed
to be a compiler back end, not a general purpose assembler. I may find it
as clumsy as anyone else, but I do realize why it is that way.

From: SOCS18@vaxb.york.ac.UK
Message-ID: <9005050653.AA01291@ucbvax.Berkeley.EDU>
Source record: 241115

Somebody wondered why, if they installed more than one GEM application to autoboot under TOS 1.6, only the first installed was actually autobooted.

This isn't a problem with TOS 1.6 - it was simply never designed to do this! You can only autoboot one GEM application.

I have also recently received a small program which allows STE owners to mix 256K SIMMs and 1MB SIMMs, allowing a configuration of 2.5MB in the STE. If anyone is interested, mail me and I'll send it to you.

Regards,

Mathew Lodge

Source record: 241103

Right off the bat: I'm not volunteering to manage this, and it REQUIRES a manager, so the idea may be doomed.

There are a lot of questions of the form "How do I get the ST to do job X in language Y". These are well answered with small example programs. It gets messy to try to save all of these examples in any kind of organized manner, and there's a tendency to forget whether a particular question has already been answered. The answers are generally too small for reasonable sources postings. It would be useful if someone were to collect and index these little sources, solicit new ones, link the originals to corrections and updates, and generally keep them available. Any offers? Better ideas?

What I will offer to do is contribute a few goodies of this type myself.

i believe that this is the limit that TOS 1.4 and onwards has imposed
for GEM autoboot programs. If you try to install more than one
autoboot program, only the last one will be installed.

Not really a problem, but a limitation of the desktop.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

In responding to Stephen Jacobs message of 4/30/90 where he says:
>In the article this is responding to, Bob Brodie is said to have stated that
>the TT passed FCC Approval (That, that would mean the TTp, and class A, but
>still...). I hope someone from Atari will brag a bit more to us if this is
>true. If it's true, what configuration--memory, video hardware, ect?

Steve, that is not what I stated at the meeting. I said that it is on it's
way to the FCC. To the best of my knowledge, it has not been certified.
Hope that clears that up for you. We'll save the bragging for later, when all
is passed from Uncle Charlie.

Best Regards,

Bob Brodie

Which version of STRSTRK are you using? There was a bug in version 1.0
which caused it to eat memory. This has now been fixed in version 1.1,
curing practically all of the incompatability problems.

4071. break

Newsgroup: comp.sys.atari.st
Date: 1990-05-05 02:33:06 UTC
From: jdb9608@ultb.isc.rit.edu
Message-ID: <3060@ultb.isc.rit.edu>
Source record: 241122

Does anybody know how break (i.e., ^C) works on the ST?
Is it something in TOS? (I wouldn't think so since I don't
remember hearing about it, and I know some programs don't break.)
Is it done in each language? For instance, does _main() in
Sozobon C scan stdin for ^C and _exit() if it sees it?
(I wouldn't think so since then everything would have to
worry about it.)

I'm asking because I'm toying with the idea of a vi-type
Korn shell based on RTX. I like gu:lam but I don't like microEmacs,
and I miss multi-tasking and job control. So, thinking about
device drivers, SIGSTOP, and the like, I really should understand ^C.
I suppose I could just have the cli slip in an isr to monitor
whatever tty-type input devices, and grap any ^Z that comes along,
but there'll probably be complications if I don't understand
what else is going on.

Or, does Dave Beckmyer's (sp?) shell have vi-like command line editing,
and job control? I haven't seen it, and from what I heard it's a C shell,
but if it does have those other features I'd hate to re-invent the wheel.
I've seen the RTX docs and have the highest respect for RTX's design
(it reminds me of the kernel my OS Lab team did).

4075. 2ND DRIVE FOR MEGAFILE 44

Newsgroup: comp.sys.atari.st
Date: 1990-05-05 06:56:15 UTC
From: AKISUJAR@NUSVM.BITNET
Message-ID: <9005050656.AA01473@ucbvax.Berkeley.EDU>
Source record: 241117

Hello from Singapore,

I just collected a CONNER CP3500F, 200MB hard disk and tried to install it inside the MegaFile 44 box. My intention is to use the Conner ddrive as the main Hard disk and change the re-connect the Syquest drive as 2nd drive so that I can use Syquest for backing up the data from the 200MB. However, I ran into 2 problems as follow:

1. Atari uses Hard disk with SCSI parity disable but the Conner 200MB drive is factory set with SCSI parity enable. The Conner 100MB has a jumper(E4) which can be installed to disable SCSI parity. The Conner 200MB PC board I found the solder points mark E4 but no pins installed for the jumper. My question is: Is it save to install the pins and use jumper on this drive?

2. Another problem is: The Mega file 44 has an extra 50 pin connector probably for another SCSI drive on the host adapter board, extra power supply plug as well as a bracket which pre drilled holes which perfectly match teh mounting holes on my Conner hard disk. However, when I connect additional hard disk I can't set the SCSI ID of the new drive. Apparently the SCSI ID is to be set by the dip switch on host adapter card.The syquest is set at SCSI 0 from factory and when I try changing Syquest HD to SCSI 1 the hard disk is no longer recognise by the computer.

I came across a message here few months ago that one of the 'GURU' in Germany had succesfully installed 2nd Hard disk to his MegaFile 44. I shall be most appreciative if any kind soul Guru will help me on the above problems.

4076. AMIGA 3000 & ATARI TT

Newsgroup: comp.sys.atari.st
Date: 1990-05-05 06:56:34 UTC
From: AKISUJAR@NUSVM.BITNET
Message-ID: <9005050656.AA01503@ucbvax.Berkeley.EDU>
Source record: 241118
Body handling: HTML body converted to readable text

Hello from Singapore,

Below is on of the messages I receive from Info_amiga List.

Should I wait for the Atari TT or should I dump my Mega 4 and get Amiga 3000?
The 25Mhz version must be fantastic.

Don't get me wrong. I like Atari and I have been using the Atari since 1985.
I still have the first 520ST as well as Mega 4. However, the following new is
so tempting. I prefer to use my Mega4 with Turbo16 chip and Spectre GCR than
the Mac Plus which given to me by the University. I am now waiting for the TT.
But with only 16MHz? I am not so sure now whether I should keep on waiting.

I am not intend to start the flame war. My point is that

Atari never bother to offer educational discount and now my students can buy
a Mac SE with Hard disk for lot less than getting Mega 2 + Monochrome Monitor
and no hard disk. They also get free Hypercard with the Mac. Of course we all
know that the Mega is far superior but I can no longer recommend them to by
Atari with 10% discount when they can get 40% discount from Apple.

Date: Fri, 4 May 90 17:44:00 EST

Sender: Info-Amiga List
From: D_BLEZARD@UNHH.BITNET
Subject: RE: A3000 Student Discount
To: "S. SUJARITTANONTA"

Here's the basics once again on the Commodore Student Dicounts:

1. All certified schools, teachers at such schools, and ONLY
post-secondary students qualify.
2. The necessary forms and current price list are available only
through your local dealers. Contact C= if you need to find one.
3. The discounts are from 45% to 50% on packaged systems. Separate
components are at 40% off and must be purchased with a CPU (unless the
component deal has been extended again.)
4. Payment is upfront in cash or certified check, only one purchase
per year, and lots of other assorted legalese.

And now for the rumors: I heard a few days ago from the local dealer that
the A3000 will be available on the discount plan at the same savings. A
hypothesized system of an A3000/16 and a multisync monitor should be right
around $2000. Definitely not bad.

If you're worried about that, give Jim Allen(of Turbo 16 fame) a call. Of
course he won't be able to commit to anyrthing until he actually _sees_ a
release version TT, but he has mentioned the ease with the TT can be accel-
erated on GEnie.

Yep... I believe that Atari would pick up _more_ than a few sales by
1) Making ST, Mega, TT _available_ at university computer shops in the
first place.
2) Offering a student dicsount on said machines
3) Placing ads in campus rags like Apple, Zenith, IBM, and NeXT do.
(They sell a lot of Zeniths even though they're nothing _too_
special). I saw a young woman buying a NeXT because "daddy"
was going to buy her a computer and the guy at the store was
telling her what a great one the NeXT was. I feel sorry for
when she wants to do anything as simple as install a piece of
new software not understanding Unix/Mach.)

It wouldn't be too tough to do, I imagine. Even step 2 could be implemented
by itself just to nullify the competetion's power/price advantage.

Access to the /atari/new directory has been changed to write-only for anonymous ftp users. Probably so programs can be checked out before people start using them, or maybe to stop people from using that directory for their own purposes, I don't know.

Yes, this would be an excellent way to spread documentation about the ST. How about one example for each BIOS, XBIOS, and GEMDOS call? A few complete AES/VDI-based programs? Examples that show how to read the right mouse button, use the VBI queue, work with GDOS.

Any volunteers?

4081. update on getting GNU Emacs to work

Newsgroup: comp.sys.atari.st
Date: 1990-05-05 17:26:50 UTC
From: rcb@ditka.UUCP
Message-ID: <24485@ditka.UUCP>
Source record: 241124

I was finally able to dump GNU Emacs. I fixed the problem of temacs reporting "End of file during parsing" reading through the loadup.el file by commenting out the reference to "load site-load file" and just including the contents of the site-load file itself. As far as I know, running 'dumpfix' went OK and I now have a valid dumped emacs.

The question is now: when I run xemacs, it always says that it can't find the termcap file. There is a file in the distribution which claims there is a sample termcap entry for the atari included, but I can't find the sample anywhere. Does anyone have a termcap for atari's vt52 emulation? For now, I'm going to get all vt52 entries out of the termcap file here, but a specialized termcap for the atari is probably better.

Thanks to Ed Roeder for his help in getting me this far.

Roy Bixler

>their own purposes, I don't know.

This is a simple security precaution. By preventing anonymous users from seeing the filenames in the directory, we reduce the chance that some malicious screwball will replace a valid program by a virus-infested one (for example) by uploading a new file with the identical name. There aren't too many good solutions to managing an archive that's globally writable.

Hard to imagine someone deliberately sabotaging an archive site, but ya never know. At any rate, with the new indexing efforts, files shouldn't stay in new very long anyway.

Ctrl-C doesn't generate any special interrupt. The behavior of Ctrl-C
resides in the GEMDOS Cconin and Cconout routines. Thus, you can only
use Ctrl-C to terminate a program while it is reading or writing the
console.

The manual for MT C Shell says there is full screen command-line editing.
It sounds pretty good. I haven't seen it yet, because the disk I received
was bad. The description of the built-in commands reads just like the BSD
C-Shell man page; most of the features are there. Unfortunately, unlike
the BSD shell, looping constructs are only usable in scripts. (So much for
aliases & such that do foreach and while loops...)

Meanwhile... Ctrl-C and Ctrl-Z are handled by the tty driver in Unix.
The MT C Shell manual makes no mention of using any special tty driver
with RTX. Wish I could run it right now and find out... (The disk is in
the mail? }-)

> stated that he should soon release an improved version with support for color

i dont know about dvist, but a new version of Robert Stabl's showdvi (v 0.80) is available for FTP on dsrgsun.ces.cwru.edu in pub/atari/StTeX/showdvi-0.80.zoo. this version will run on color too. besides this change, the new version has lots of new features, is much more flexible in terms of setup, options etc. IMHO showdvi is the best dvi previewer for the St, commercial or otherwise. kudos to Robert Stabl and Georg Hessman for the great job they have done with showdvi/flib/dviprint.

PS: if you get showdvi for the first time, please pick up showdvifonts.zoo (the font libraries) from dsrgsun too. if you already have the font libraries (from the comp.binaries.atari.st posting of the earlier version of showdvi, or from dsrgsun), before you use the new version of showdvi, you will need to convert the font libraries into the new format. to do this run ``flib -z <library>'' (using the new version of flib.ttp, also in showdvi-0.80.zoo).

PPS: showdvi-0.80.zoo also contains flib.c, that can be compiled on a unix host too, making it convenient to make font libraries on your unix host, if you run MFont there.

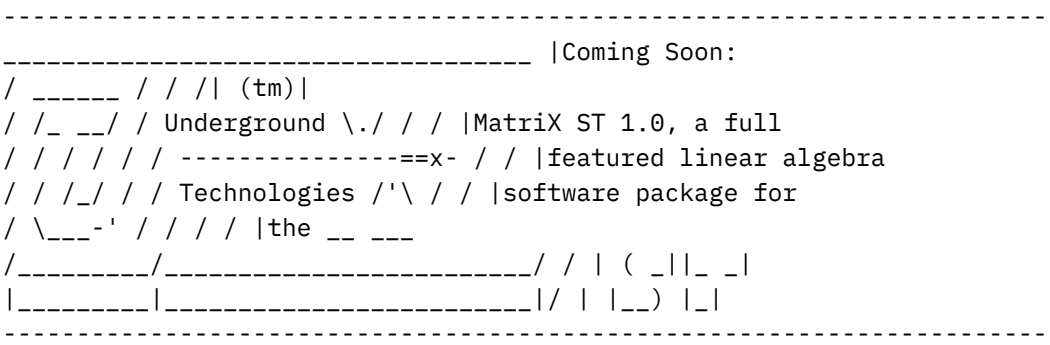
Entered: Underground Technologies (R)
Subject: Seperate Keyboard and CPU

I am planning on butchering my old 1040 into the standard seperate keyboard and CPU to allow more space for expansion and the added convenience of a detachable keyboard. I wish to use a 150W power supply that are sold to power IBM clones. Are the connections for the ST supply the same as the ones for IBM clones? If not is it possible to change the connections so this can work?

Ken Yu@mts.rpi.edu



4087. Re: Fortran 77 (was Re: INFO-ATARI16 Digest V90 #500)

I use Prospero Fortran. Though it's slow, I like it, for its source level debuger and the possibility to link it together with ANSI-C, Pascal, and Assembler. All integrated into one Workbench together with a make for a reasonable price. O.K., it's slow, we know this. But Use this time to think about your code. TURBO-XYZ is a little like an interpreter. You're using the speed for syntax checking only.

CU Carsten.

4088. Still trying to get Omti MFM, ICD interface and Seagate 4038 working

Newsgroup: comp.sys.atari.st
Date: 1990-05-06 12:19:00 UTC
From: pbh@pandora.cs.wayne.edu
Message-ID: <1990May6.121900.17507@cs.wayne.edu>
Source record: 241131

I purchased a 30M hard drive a while ago, and it formats fine, partitions fine, but when using ICD's hdutil.prg, the program reports that it cannot find a partion that can support autobooting. I set up all the partitions as GEM partitions. When I called ICD, they said (1) change all the partitions to XXX, then repartion, them back to GEM, and repartion, as the partition info may not be getting written. Nope. Didnt work. (2) dload hdutil from their bbs, as the copy I have may be corrupted (I just received the new ICD disk a week prior). Still no success. Each time I set up to put autobooting on the hard drive, it cannot recognize any partion. The ICD HD ACC recognizes all of the Hard Drive Partions, as does the icdfmt utility. It's hdutil that's giving me problems.

Is there anyone out there who's had any success getting hdutil (ver 3.51 i believe) working with a Seagate 4038, or any SCSI drive?

>saj@chinet.chi.il.us (Stephen Jacobs) writes:
>>
>>There are a lot of questions of the form "How do I get the ST to do job X
>>in language Y". These are well answered with small example programs.

I agree this would be a wonderful thing. No, I can't do it.
I don't own a site, nor have the storage, and I keep moving.
I just wanted to say that I think that good indexing will be
crucial to its usefulness. I can imagine stuff going in but
never coming back out because users can't find what they're
looking for--then it would be no better than the net now.

I suggest that the manager of the archive will have to read
each submission (I doubt there'd be more than one or two per day),
anticipate its usefulness, and assign appropriate
keywords. (This would be important and take some skill.)
The new article number (or whatever naming scheme is used) and
the keywords for that article can then be added together on one line
to a global index file. Users can `ftp` the index file and then do a
`grep '(key1)(key2)(key3)' index` kinda command to get just the
files they want. E.g., `grep '(hirez)(vdi)' index | grep -n '(window)'`
would list all the files related to vdi calls on monochrome systems
which are not related to using windows. Okay, so it's not a very
practical example, but you get the idea of the flexability and power
once the indexing is done and the keywords are made available.
Regularity of the index would be crucial, so using the supplied
keywords would be unreliable.

It doesn't have to be just source code either. I've seen some
awfully useful little chunks of text floating by here that I was
sure I'd want later, but knew I'd never be able to find again
even if I tried to archive them.

Of course, a server should be available to do the `grep` locally
and return the results to those who only have mail capability.

Is there anyone, who has a real nice working RZ and SZ, which behaves
just like those found on this XENIX-Machine here(sending one DATAstrap)
The Version i have waits allways for the receiver to call for MORE Data.

If there is someone, who got those, could he post them to me...
And should he have the coresponding sources and they are PD, than i would
be glad to get those too..

Thanx in Advance

>
>Does anyone have the instructions for this emulator. I got it when
>I bought my SLM804 and sort of got it working but there are some
>weird things about it. Why can you create a config. with more then
>one printer font in it when you can only use the first font in the
>config. list - perhaps its possible to change font (which would be
>very nice). Does anyone know anything about this?

Like most printers, the Diablo emulator for the SLM804 accepts a variety of escape sequences to control various functions. The sequence
ESC, SO, d
selects font "d", where d is an ASCII decimal digit. Here ESC is ASCII code 27 and SO is ASCII code 14. Thus, the decimal codes to select the font in slot 3 are:
27, 14, 51
(since 51 is the ASCII code for '3'). Many other escape sequences are supported. Consult your manual for details.

>While I'm asking for documentation does anyone have any on the SLM
>itself? I'd be really interested in knowing how to control the beast.

You should have received a manual with your printer. You'll need it when time comes to add toner, change drums, clean fuser rollers, and so forth. There isn't much to "control" with a laser printer; basically you feed it with paper and run appropriate software. There IS a lot that can be controlled with the Diablo emulator software---you do this with two programs: SETUP630.PRG and SETUP630.ACC. They take the place of the front panel switches found on other printers. If you don't have these, you will need to get them.

4098. v11INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 01:34:21 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <1740@male.EBay.Sun.COM>
Source record: 241137
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 11, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
much means arc, zoo, and lharc. If you want to use a nifty new archiver,
make the source code available to the public (posting to comp.sources.atari.st
```

is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v11INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v11i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 11. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v11i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution

1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 11, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

4100. v11INF3: Unpacking binaries (and retrieving old ones)

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 01:34:50 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <1742@male.EBay.Sun.COM>
Source record: 241139
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: May 6, 1990

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator

will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segre-

gated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is

available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

Using Binaries -5-

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

4101. Zmodem and the ST...

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 02:52:34 UTC
From: logic@wet.UUCP
Message-ID: <1196@wet.UUCP>
Source record: 241163

Is there a terminal program out there which has a good implementation of Zmodem? I'm currently using ZMDM v1.85, which gives fairly good throughput on downloads (~1625 cps on a HST/DS) but doesn't seem to do streaming correctly on uploads (~700 cps on a HST/DS). I've also tried RZ.PRG/SZ.PRG but they don't even seem to work at all. I thought that the Mac terminal situation was bad but recently with Zterm, MP III, and WK, they have at least three programs with good Zmodem whereas we don't have any (that I've found). Anybody have any good ideas or tips?

4102. Mac-->Atari Sound Converters

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 04:22:49 UTC
From: ccm020@deneb.ucdavis.edu
Message-ID: <7281@aggie.ucdavis.edu>
Source record: 241142

Does anyone know an FTP site where I could get a utility to convert Mac format sound files into Atari format? So, for example, I could use Kermit to xfer a Mac sound to my Unix account, and then Kermit from my ST to xfer it back, and then use this program to convert it to a useable format. I think there was such a program in STart a while back, but I never got the disk.

4103. Re: Educational discount.

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 05:13:35 UTC
From: fnddr@acad3.fai.alaska.edu
Message-ID: <1990May7.051335.19966@hayes.fai.alaska.edu>
Source record: 241140

In article <35003@shemp.CS.UCLA.EDU>, stephen@oahu.cs.ucla.edu (Steve Whitney) writes...
>Yep... I believe that Atari would pick up _more_ than a few sales by
It has been pointed out numerous times over the years in this group that Atari doesn't want to sell machines in the US, and they are doing an excellent job of it. However, if they ever change their minds, educational discounts would be a good start. I actually recall them advertising a small discount a few years ago as part of a back-to-school promotion.

> 1) Making ST, Mega, TT _available_ at university computer shops in the
> first place.
Very important.
The Atari store is across town from this campus. Many students don't own cars. Those that do have a hard time getting off campus during normal business hours due to classes and classwork. Why should they bother to drive a few miles to check out Atari when they can purchase Apple, IBM, Toshiba, Zenith, NeXT, etc on campus (with the cooperation of the local dealers, I might add)?

> 2) Offering a student dicsount on said machines
I've asked the local Atari dealer several times why they haven't pushed for this. Their answer: "Atari's prices are already lower than anybody else, so why bother?" This is of course false. Also, I've noticed many students seem to believe that if brand X offers a discount and brand Y doesn't, then it must be cheaper to buy the brand X system. Faculty say things like, "the brand X discount program shows that they are committed to higher education; brand Y obviously isn't, so avoid them." Brand Y is, of course, Atari.

> 3) Placing ads in campus rags like Apple, Zenith, IBM, and NeXT do.
The Atari dealer does here, periodically. It seems to help somewhat in offsetting the damage done by lack of (1) and (2), in that there are some students and faculty who have STs.

I would also add:
4) Introduce an ST variant with built-in thinwire ethernet.
On this campus and many others, a machine won't even be considered for classroom/lab use if it can't be networked. And students want to buy the same machines used in the classes and labs so they can use familiar software with it.

>It wouldn't be too tough to do, I imagine. Even step 2 could be implemented
>by itself just to nullify the competetion's power/price advantage.
Sad but true. You can mail-order fast 286 and 386sx systems w/hard disk for the cost of the Megas, and the university discounted Apple and other big-name systems are comparable in price.

>GEnie: S.WHITNEY `-----'
I'm not even a student anymore, so I'm not arguing for a student discount because it would do me any good. I would just like to see Atari go for the university market, because it seems to me like one of the few options they have left to find a niche for themselves. Even though my STs are 4 years old, I'd hate to see them orphaned when the parent company dies.
I certainly don't plan to buy more Atari equipment until I see some evidence of intelligent life in Sunnyvale, though.

4104. FTP strangeness at dsrgsun (no response to ``dir'')

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 13:14:15 UTC
From: jensting@skinfaxe.diku.dk
Message-ID: <1990May7.131415.5753@diku.dk>
Source record: 241151

When doing anonymous FTP to dsrgsun.ces.cwru.edu, I can't get any response to the ``dir'' or ``ls -l'' commands. FTP opens an ASCII mode connection, waits, and reports that the transmission is terminated; no data is written to the screen.

The reason I'm posting here is that the problem may be dependent on my site (diku.dk, Denmark), and I'd like to know if any others have the same problem.

The problem is really bad when the README file is not updated, and you can't even see the date of any files that may be new and interesting..... .

Yes there is. Tim Onders (onders@harvard.uucp) has
made available the GNU port to the ST.

An almost complete minimal system was uploaded to CIS :-$,
(no gas Tim.) And I can testify that:

```
cout << "Hello C++ World\n";
```

works.

In addition, Tim will real mail you the complete ST
distribution of the GNU stuff for $35US. Contact him
via e-mail for more information.

And just when I was ready to junk the puppy someone ports
something worthwhile to it!

>pixels on a multisynch, I have seen it advertised in ST-Computer (Feb 90) and
>I was wondering if anyone could comment on compatibility etc. It is the one
>which costs 249 DM.

From the review in the German magazine c't, March -90

Available resolutions
640 x 608 60 Hz
832 x 624 50 Hz
640 x 480 75 Hz
704 x 496 71 Hz
640 x 400 87 Hz

Mega-ST only (needs the expansion plug)

Needs TOS 1.2 or later.

Only in monochrome mode.

General stuff

Seems to require a multisynch monitor because of the
large number of resolutions. I don't know about
that, what about running with the normal monochrome
monitor in 704 x 496 mode ?? (This mode only, of
couse, but still.)

Made from a Hitachi video controller, and four small
chips (say three normal TTL chips and one PAL). Works
by reprogramming the video timing and using a larger
amount of Atari video memory.

The name is MegaScreen, the manufacturer is WGR
ComputerSysteme (no address given in the test, no ads found
in the magazine).

Should be usable on all ``well-behaved'' programs..... .
I can't see how they could make the 640 x 400 mode
incompatible, as far as placement of video meory goes,
so I should think that in 640 x 400 mode the ``dirty''
programs could write to the screen memeory as they like
(although the programs may break on the higher frequency..).

Comes with software for the AUTO folder, plus a configuration
program.

That's about it, very small test for c't (only two pages, no screen shot).

In the May issue of c't, a card using the INTEL 8xxxxx graphics controller
and 1MB memory, is tested, HOT STUFF !!. Claimed to sell with monochrome
19" monitor for the 1660 x 1200 mode for 5500 DM. The board even
has a socket for the MC68881, so that you don't have to loose your
coprocessor.

>and then use this program to convert it to a useable format. I think there
>was such a program in STart a while back, but I never got the disk.

You can use the .data files pacakaged with Mac sounds directly on the
ST. You don't need to do any conversion. Just take the .data file,
get it onto your ST, then try it out with play.prg (posted to
comp.binaries.atari.st recently) to get the playback rate right. You
can then use the sound with the Digital Keyclick, Beep, and Digivec
programs recently uploaded to terminator (soon to appear in
comp.binaries.atari.st).

Many of the sounds in the terminator archive are actually Mac samples.
Please upload any interesting sounds you find to
terminator:atari/music/samples
so everyone can try them out...

> set by the dip switch on host adapter card.The syquest is set at SCSI 0
> from factory and when I try changing Syquest HD to SCSI 1 the hard disk is
> no longer recognise by the computer.

Both SCSI drives in a Megafile 44 have to be selected as SCSI drives 0. The
Conner drive must plug into the first SCSI connector (J2, as far as I remember)
and the Syquest drive into the second one. Moreover, you'll have to flip
DIP switch 1 so that the ATARI hostadapter knows that you're trying to
install a second drive.

Hope this helps,

Claus Brod

> remember hearing about it, and I know some programs don't break.)

Yes it is done by TOS. But only the GEMDOS functions Cconin/Cconrs/Cconout and Cconws use it. If a program uses BIOS for terminal-i/o, it has to do the ^C trapping itself.

> and I miss multi-tasking and job control. So, thinking about
> device drivers, SIGSTOP, and the like, I really should understand ^C.

Have you seen the demo of Master? This shell has job-control (but no multi-tasking). Jobs are created by system("-i") from C-Code, by 'if exec "-i"' in a batchfile or you can start your program as 'program args |' and then input '!-i<Return>' at the prompt after any full screen of output. Stopped jobs may be restarted by '%<job-id>' in any order.

> I suppose I could just have the cli slip in an isr to monitor
> whatever tty-type input devices, and grap any ^Z that comes along,
> but there'll probably be complications if I don't understand
> what else is going on.

The catch-program posted to comp.binaries.atari.st does it just this way. You can install it in your auto-folder (catch.mmx has to be renamed to catch.prg) and let it catch any ^C/^Z/^\-keypress at any time (even if your program is in an endless loop). If ^C is pressed, you are asked wether you want to break or continue. If ^Z is pressed, an eventually installed shell (at _shell_p) is called interactively. See catch.doc for more uses of this program.
If you want to know more about ^C-trapping, you can also look up the documentation for etv_term (the terminate-vector of GEMDOS).

4110. Re: Mixing C and Assembly

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 15:14:31 UTC
From: dag@persoft.com
Message-ID: <1990May7.151431.15956@persoft.com>
Source record: 241154

The assembler shipped with the Mark Williams C package uses a Unix V7 style syntax. The object file format is also modeled after the Unix V7 object file format, allowing for long symbol names (the object format supports flexnames, the compiler doesn't generate them) and the symbol table is case sensitive.

MADMAC was produced by Atari long after MWC shipped its compiler package and the object file format was pretty much determined.

When the MWC object file format was determined there was no acceptable standard available. As a result they ported their Coherent object format and tools to the 68000 and the Atari ST. (Coherent is a ground-up/clean-room implementation of Unix V7.)

The compiler can be made to generate Motorolla style assembly with an undocumented switch (which I cannot recall at this moment, try -VMOTO or something like that), and there are converters available for MWC->DRI and DRI->MWC object files. Note that the Alcyon/DRI compiler uses the leading "_" on symbol names, whereas the MWC compiler uses a trailing "_". The converters handle this.

>resulted in more GDOS fonts being available (a la Mac), and also more drivers.

ATARI Germany supports a book called "Vom Anfaenger zum GEM-Profi" published
here in Germany. This book tells you lots about current GEM and GDOS standards,
though it's not a complete GEM reference. Other standards (GEMDOS networking
standards et cetera) have been talked about and settled in developper
conferences at ATARI Germany. So things seem to improve gradually.

> So back to Atari. You guys youve got the data, youve got the ability,
>why not do it. Just think of the money.......yes money......

I don't think money is the problem. They have problems in getting the TT out
of the door, and so they don't have any TIME to do much doc by themselves.
At least, this is the way it seems to be.

RLL is a modulation technique, that's right. Drive manufacturers tell you
not to use RLL controllers with drives that aren't RLL-certified. You can,
however, use many MFM drives with an RLL controller, but nobody guarantees
you it will work.

>2. My understanding is that a hard drive for the Atari ST needs three

> I'll need to bypass the host adaptor part. Any tips?

You've got it quite well. Nevertheless, I don't know any way to bypass
the host adaptor part of the Megafile's controller board since both
parts have been combined. You might try to get a stand-alone Adaptec
RLL controller from Adaptec or from an old SH204, but I guess it'll
be cheaper and easier for you to get a real SCSI drive and sell your
Megafile.

>bus error. Its purpose is unknown.

XBIOS(64) has been there since TOS 1.2 and is used to detect the blitter status and turn it on or off. It has been documented officially. Looking at $FF8A00
in a non-blitter ST causes a bus error, while a ST with the blitter installed
doesn't mind. This way, you can detect the blitter chip.

>Going through the initialsation stuff, the code is also mostly as before.

>information only- their pupose is unknown.

The things you found at $980 onwards aren't new system variables. ATARI
calls it the 'cookie jar', and it is used by TOS and programs to notify
other programs that they were there and they have done something to the
system. All cookies starting with _ are reserved for ATARI, and they
use them to publish machine data to other programs (CPU type, shifter
type etc.).

4115. Re: poolfix3, poolfix4; naming conventions.

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 16:32:43 UTC
From: csbrod@medusa.informatik.uni-erlangen.de
Message-ID: <2709@medusa.informatik.uni-erlangen.de>
Source record: 241155

Dear Mr Pratt,

since I don't have regular access to Usenet, this letter might be somewhat late. People have told me about your reactions towards my version of POOLFIX, and I would like to add some comments.

You're right, naming my POOLFIX version "POOLFIX4" was foolish. I've changed that quite a while ago; unfortunately, Chris posted POOLFIX4 before I renamed it to POOLF_CB (just a suggestion, I've not settled yet about the final naming). So if this is your only problem with it - it's been solved. Sorry.

I always thought ATARI had an interest to spread TOS bug fixes as widely and as fast as possible. Everyone owns FOLDRxxx, for example, and ATARI doesn't moan about it - though not everyone has bought an original ATARI hard disk. I didn't want to infringe any copyrights, as you supposed, I have always stated very clearly in the POOLF_CB readme file that this program was originally written by you, that I didn't claim any rights on it, and that I only improved it a bit.

You also felt unhappy about me possibly being a malicious hacker spreading dangerous code under the hood of an original ATARI program's name. POOLF_CB and POOLFIX4 are no Trojan horses, and I've invested much time and effort to verify that it works properly. I've sent POOLF_CB to ATARI Germany hoping that it might find it's way to you. I didn't wait for your approval, true, and I regret this, but I had my reasons: People found out that POOLFIX3 (your version) didn't work when my hard disk driver was running, and soon there were rumours that my driver was faulty. This, however, isn't true, but it started to damage my reputation among European users. I didn't like that, so I sat down to find out more about it, disassembled POOLFIX3, found out why things went wrong, and patched it. Some friends needed this version badly, and so I gave it to them, and I even allowed Chris overhastedly to spread it via Usenet because I felt strong demand for it.

Another point: You were in doubt whether it's worthwhile to optimize the POOLFIX code in order to obtain a smaller program. Well, I think it is. (This isn't much of a surprise for you, I know.) True, it will save you just a few bytes, but if ATARI had done a little-bitzy-eenie-weenie bit of optimization in their ROM code it would have been possible to include GDOS into the TOS ROMs. (When the ST appeared here, ATARI officials always said that GDOS was published separately because it didn't fit into the ROMs.) Think of all the trouble this would have saved us: Thousands of proprietary printer drivers and hundreds of GDOS incompatible programs. It also would have improved the reputation of ATARI's implementation of GEM. If you don't believe me you can

squeeze GDOS into the 192 KB ROMs, ask our German hackers for a version of their improved TOSses. (Besides: I recently did a bit of optimization on the current German GDOS version, AMCGDOS, and it lost some 2 KB in size out of nearly 8 KB. Don't worry, I won't spread it, I'm just using it for my own ST - only the author of AMCGDOS received a copy.) Some of those hackers mentioned above saved so much code that it became possible to include a new Macish DESKTOP, new window features, a complete hard disk driver, and, last but not least, GDOS. Needless to say that they also squeezed TOS 1.6 into 192 KB ROMs. Don't panic, since ATARI doesn't seem to want outside improvements for TOS, they won't spread it. Some of them, however, have written long and detailled letters to ATARI about ways of optimizing TOS, and apparently there has been no reaction. (The bug patched by POOLFIX, for example, has been known here since the 8-8-88 beta version of TOS 1.4, and it has been reported to ATARI before the end of the beta test phase.)

POOLFIX will find it's way into thousands of AUTO folders, so it will cost most of us some of our precious RAM. Yes, I think it's worthwhile investing some effort in it.

I will stop optimizing POOLFIX and copying it to my friends who beg for it if you want me to. But then, I'd like to ask YOU for an official POOLFIX4 version from you that doesn't collide with my hard disk driver and numerous AUTO folder programs any more, so that I can stop wasting time telling readers twice a day that my driver is OK, and that the problem lies in POOLFIX3, and they should use POOLF_CB if they can get it anywhere, but no, I won't copy it because ATARI doesn't want me to, or they should delete POOLFIX3 from their AUTO folder or use another hard disk driver. Please!

I strongly hope we will come to a good compromise that satisfies the needs of all ST users. Apart from that, I really appreciate that you follow this discussion and comment on selected items. It has been a great help for us here in Germany. Keep it up!

Sincerely,

Claus "all-time optimizer" Brod

4116. Re: Phantom

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 18:00:00 UTC
From: micro@imada.dk
Message-ID: <751@imada.dk>
Source record: 241156

We hear about the Phantom all the time, at first I didn`t believe in
`it`... (for a year or so) and then it stroke me in Tempus.

I were able to have `it` for 3 hours (moving the mouse really speeds
things up).

Ok I were able to quit Tempus, returned to the desktop and every thing
still were acted very slow (clicking and moving the mouse simultaneously is
kind of tricky...).

But now to the interesting parts, disconnecting the keyboard on my
MEGA (and thereby Reseting the keyboard cpu) did not affect the phantom,
notice that pressing the reset botton on an MEGA does not reset the keyboard
cpu...

More interesting things, starting new GEM programs did not affect the
phantom either...

BUT NOTICE - starting a non GEM program momentally stopped the phantom.
I started BUG - the debugger from the turbo C package, and everything
was as nothing had happened. I looked after suspicious code on the system
vectores (viruses) but I were not able to find anything.
When returning to the desktop the phantom were there again...

Then I killed the phantom, it`s easy - just press CTRL-ALT-DELETE and off
he goes... (or the little botton at the back called RESET).

Where does this leave us ?
- Not hardware (surely not the keyboard).
- Not in the TOS (Bug uses Gemdos, Bios, Xbios).
- Could be in GEM somewhere (I had a drawing program running too -
so it could not be in the VDI)
+ this leaves us with the AES...
- what about the dispatcher (evnt_xx calls) ??

I guess this problem is for the people at Atari to fix...

- Klaus (micro@imada.dk).

> a second drive). What will I need to know when choosing which drive
> to buy?

Well, I don't know much about hardware, but I can tell you about this
point. It is possible, and not a bad idea, to put a second drive into
the megafile 30 and on the hostadaptor of it. (Hope you get my
english...)

Well, there are lots of people in the atari.ger.fido (Fido Nets Atari
Board in germany) who discussed this problem some time ago. I myself
want to put a new, second drive in my megafile, as soon as i got the
money. I think about 60 MB, 3,5" and RLL.
Well, the hardware in the megafile is in some way ready to accept a
second unit ! I can't tell you exactly, but there shurley many people
out who know...

The software is the other prob - AHDI is, as far s I know, not prepared
for a second unit. And it has some bugs besides that point ...
I use CBHD SYS. This is a very nice hard disk driver. It is based on the
AHDI and rerwritten and very improved by a german called CLAUS BROD.
He wrote aa nice and good book about floppies, harddisks etc on the st
and inculded a disk within the book. This driver allows you without any
problems to access a second unit in the megafile 30 or to boot from the
partition you want (up to 12 are possible i think)...

Well, overall its a great thing. Claus Brod is unfortunately no more
contactable via usenet, but maybe I could help you a bit...

As far as I know, you need Signum Version 2.01 to run it with Gemini and
activated AMCGDOS. But I haven't checked it out myself yet...
Otherwise you only can press "shift" while loading amc...

4120. Problems With BMS-100 & 520ST...

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 20:27:03 UTC
From: mowgli@dinghy.cis.ohio-state.edu
Message-ID: <80180@tut.cis.ohio-state.edu>
Source record: 241162

I've been having major problems with my ST lately. The system is a 520ST, Z-RAM 2.5M upgrade, BMS-100 HD I/F, & 2 20Meg HDs. The first HD has partitions C, D, E, & F (5M each). The second HD has partitions G (2M), H (3M), & I (15M). And, the RAMDisk is partition J.

The problem is, when I boot with my HD on (using the HD boot disk), the system runs things off both the floppy drive (A) & the 1st HD partition (C). It also copies a whole bunch of files from partition C to the RAMDisk (J). Then, when I get to the desktop, NO ICONS show up at all! This has lead me to the conclusion that the primary FAT is in la-la-land. The files copy from the HD to the RAMDisk properly, so I know the HD is still there SOMEWHERE.

So, does anyone have any other theories as to what has happened? And, more importantly, can anyone point me to tools which will perhaps resurrect the FAT, so that I don't have to reformat my HD to use it again?

Thanks, <Mowgli>

Can't one just replace the gemdos trap vector with an address of one's own
routine? Check if it is a output call and buffer or save the output to
a file.

4123. format program

Newsgroup: comp.sys.atari.st
Date: 1990-05-07 23:40:55 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <3357@calvin.cs.mcgill.ca>
Source record: 241166

I use Pcommand and gulam frequently, and hate having to leave
the shells to go to the desktop whenever I want to format.
So I decided to start writing a program which works like the
pc formatter, i.e.

format a: /s2 will format a: for double-sided disks.

I am using the example from Laser C which formats disks (pg451 of the
manual) Here is my problem:

I also want to be able to format 10 sectors/track. Unfortunately, the
procedure which writes boot sectors, Protobt, has 4 possible disk
types, none of which are 10sectors/track.

Also, how come the procedure which writes bootsectors to the disk
first writes 0'd buffer to track 0, if presumably, the procedure
is being called right after a format??

And for double-sided disks, isn't it necessary to zero the second
side of track 0 as well [if it is necessary to do the first side].

Oh well. Also, if I am re-inventing the wheel, and you happen to have
done it already, could you send it to me?

>Dave,
>
> I have been told that you can use The DCPort with RTX, but I need to
>know how. I don't want to invest alot of time developing a package without
>know how to do this.

I'm answering this here because I couldn't get mail to Mr. Costello and
because a lot of people have asked about this lately.

I have just finished a first cut at RTX DC-Port drivers. I think I will
give the source back to Double-Click and let them decide what to do with
it reather than sell it. The other drivers I have for RTX I sell for $100.

I have posted to GEnie a description of the specifications of the RTX
d_cntrl interface for "standard" TTY drivers (i.e. how you check for carrier
and control DTR, etc.) If there is interest, I can either mail this
documentation to those interested, or perhaps post it.

>types, none of which are 10sectors/track.

Right, Protobt can give you four different standard disk parameter
sets only. If you want to have your own non-standard format (and
10 sectors are non-standard though perfectly safe) you'll have to
patch your bootsector yourself. No big deal, really, because you can
call Protobt first to create a standard BPB block in your bootsector
and then change some values like sectors per track, sectors per disk
and so on.

>And for double-sided disks, isn't it necessary to zero the second
>side of track 0 as well [if it is necessary to do the first side].

You should zero all FAT sectors and all sectors of the root directory.
Some early formatters wrote a $E5 pattern to the root directory, but
this leads to very long search times in the root dir. ($E5 means "hey,
GEMDOS, this dir entry has been deleted, but there might be some valid
entry after me").

Claus Brod

Yep. I've the same problem here. Even a simple "ls" fails from one of our systems (Harris HCX-9). Judging from the fancy message of the day that is displayed at dsrgsun, Bammi must be running a hacked up version of FTP; it's probably just a bit to much hacked up ;-)

I think that one lesson we should all learn from this and from stories
people have told about variations in Developers Kit policy, TOS 1.4
distribution, etc. is: NEVER assume that one bit of Atari will tell any
other bit anything at all. Atari just isn't that organised. I
sometimes wonder how the company keeps going at all.

> Some of those hackers mentioned above saved so much code that it became
> possible to include a new Macish DESKTOP, new window features, a complete

> reaction. (The bug patched by POOLFIX, for example, has been known
> here since the 8-8-88 beta version of TOS 1.4, and it has been
> reported to ATARI before the end of the beta test phase.)

Again, if you're not writing directly to the people who maintain TOS,
forget it. Descriptions like these, though, serve as a reminder of just
how much of the ST's potential has been wasted. Getting the original ST
out so fast in 1985 was a terrific achievement, but the follow-through
has been a real disppointment.

Claus Brod has made some good points in a very reasonable way. If his
pool fixing program does what he says it does, and doesn't hurt anything
else, then I can see no reason why it should not be distributed. Why
not let Allan Pratt add his comments (and maybe even POOLFIX3) and let
users decide which version they want to use?

You have to make sure that there is enough memory to run Zmodem (or any
other program) from Uniterm. By default Uniterm takes almost all memory for
its buffers. Just make the buffers smaller until you have a fair amount of
TOS memory left.

4133. GCR autoboot problem

Newsgroup: comp.sys.atari.st
Date: 1990-05-08 12:32:55 UTC
From: silvert@cs.dal.ca
Message-ID: <1990May8.123255.26586@cs.dal.ca>
Source record: 241186

I've just gotten a Spectre GCR and have run into an exasperating problem trying to get a partition of my Supra 60 Meg HD to autoboot. It will autoload OK, but although I have tried several different system/finder sets, and also used the System 6.0 install procedure, it absolutely refuses to boot from anything but a floppy. It starts off with a smily face, but then turns it off and requires the floppy.

There are no other System files on the HD, and I have only one Spectre partition (16 Meg). I played a bit with the SCSI unit on the startup menu (in Spectre), but don't know whether I can fix the problem that way.

One thing that may be a factor is that I didn't have an up-to-date system when I started loading the hard drive, so the System folder was not the first item on the partition -- is that a factor? I don't want to go through the hassle of reformatting and starting from scratch unless it is necessary.

I have version 2.65 of the Spectre software. All the manual says on this problem is that "If the boot fails... assume the HD is damaged." Since this is the only problem I have encountered with this HD, is there a better diagnostic?!

Help greatly appreciated. It is frustrating sitting there with a 19 ms HD watching the boot floppy spin endlessly every time I try to do anything!

4138. Hard Drives?

Newsgroup: comp.sys.atari.st
Date: 1990-05-08 14:59:17 UTC
From: mck@beach.cis.ufl.edu
Message-ID: <23140@uflorida.cis.ufl.EDU>
Source record: 241184

I am posting this for a friend and I personally have no experience with
the Atari ST. So, please send responses via e-mail to:

mck@beach.cis.ufl.edu

Also, please form your responses so that even a Macintosh person can
understand it (I'm showing my bias).

Anyway, my friend wants to know if a Quantum 105Meg drive for a Macintosh
can be used in an Atari ST since they both have SCSI interfaces? If it
can be done, what needs to be altered (i.e. connectors, cables, etc.)

If there is an easier route, what suppliers would give a good price on a
105Meg HD (Quantum prefered) for the Atari ST. I'm looking for minimal
effort on installation. Also, I need a response as soon as possible as
my friend is leaving for Italy in a couple of weeks.

Thanks in advance.

Mark

I coulda been a contenda, but.... everybody else has posted interesting info on the Phantom first. My 2 cents is this dump from after my machine crashed when I experienced the phantom typist. I was using Tempus II, under Neodesk 2.03 with Turbo ST enabled. I was typing quickly and goofed (read pressed 2 keys at once) when I deleted. The last two characters typed started to repeat, and when the characters reached Tempus' maximum line length, the machine crashed. Moving the mouse made the characters speed up. Oh yeah, I have Tos 1.0.

A Bus error has occurred (2 bombs)

4142. Re: C Packages

Newsgroup: comp.sys.atari.st
Date: 1990-05-08 15:57:53 UTC
From: wgg@hp-lsd.COS.HP.COM
Message-ID: <7460001@hp-lsd.COS.HP.COM>
Source record: 241179

I would also like information on the main features of the various compilers.

The Mark Williams 'C' has a unix style interface. What about Laser 'C'?
What other 'C' compilers are there?

Any help would be appreciated.

Thanks,

Grant

Actually this mail should have got through to Steven Klassen regarding the program pscapt.arc on terminator. As I can't find this file on terminator (35.1.33.8)? and don't have a correct mail address of Steven I am addressing my request to the net.

I would appreciate if Steven or someone else could send the program pscapt.arc (arced or uuencoded) via email to me. This would be really great!

4145. Problems with GNU C++ (aka. G++) - version 1.35.0

Newsgroup: comp.sys.atari.st
Date: 1990-05-08 18:26:00 UTC
From: UA1S@DKAUNI2.BITNET
Message-ID: <"90-05-08-11:26:57.23*UA1S"@DKAUNI2.BITNET>
Source record: 241182

Is there somebody out there having some experience with G++?
After installing it to work with Gemini/Mupfel (I had to patch the file 'g++.ttp'; no '+'-chars in names of environmentvars allowed, but G++ requires 'G++LIB' and 'G++INC'), taking the next hurdle: The preprocessor 'gcc-cpp.ttp' has the same name as the preprocessor from GNU CC, but it is especially designed for G++; I discovered some more serious problems:
The usual
printf("hello C world\n"):
program compiles and runs fine, but doing the same using streams:
cout << "hello C++ world\n";
It compiles, but (I think) the linker shows up with the cryptic message
"Bogon alert! wrote 400 syms, expected to write 445"
What does THIS mean???
Another problem is as follow:
Compiling programs with syntax errors often results in dropping two bombs, afterwards, I get the correct error messages about the syntax errors, everything works fine again. This can't be o.K...

Is there anywhere a newer version of G++ than 1.35.0. (I can FTP from here.)
Does any other C++-Compiler exist for the ST?
Any comments, any help welcome!

4148. Problems with drive light....

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 02:15:05 UTC
From: tmwhitehead@miavx1.acs.muohio.edu
Message-ID: <1377.264736da@miavx1.acs.muohio.edu>
Source record: 241200

I've been noticing a problem with the disk drive on my 1040 ST.

When it's been on for a little while, the drive light comes on, and stays on.

I dont hear a spinning, the light just comes on. If I access the drive, the light will go off when it is done, and sometimes it comes back on, other times it doesn't. The drive has had problems recognizing a media change for a long time now, but I usually just change the right protect status of the disk, and it reads teh new disk.

One other thing, when I boot, after it loads all of the auto programs, the desktop appears, but it remains white for a few seconds before it turns green. This didn't use to happen before. It used to go to green right away.

Auto programs:
AHDI PLAY
BEEP SKULL
CLICK STARTGEM (RUNNING NEODESK)
FATSPEED SUPERBT
FOLDR100 UISII
OATBRAN VACCINE
WATCHER

Accessories:
MOUSEKA
NEOQUEUE
TURBOST
CALLUIS

Any suggestions would be appreciated....
Thanx!

I admit it; it's my fault!

The drive light problem is caused by either click.prg, beep.prg, or both.
(Probably both.) It's completely harmless, but I admit it's somewhat
disturbing.

Good news, though: I think I've fixed the problem. I'm going to test the
new versions of the programs for a few days, then post them to terminator
again.

Are you running digivec also? Digivec waits a couple seconds after GEM
loads to install its vectors. This could be some bizarre side effect.
(I doubt it, though.)

Also, wait version of TOS are you running?

>else, then I can see no reason why it should not be distributed. Why
>not let Allan Pratt add his comments (and maybe even POOLFIX3) and let
>users decide which version they want to use?

The problem was not with the program itself, but with the author's
attitude. Allan Pratt may not be perfect, but then again if you've
every released software to the world you know that getting everything
absolutely right the first time isn't likely no matter how careful you are.

The original poolfix4 posting was one of the most pompous and obnoxious
messages I've ever seen in this newsgroup. There was more of an
"I'm a better hacker, Nyyaah!" feeling there than an "I'm trying to help
out" attitude. If I'd been Allan I would have been annoyed too.

My AUTO folder has poolfix3.prg in it.

4151. CONNER CP3500F HARD DISK

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 07:05:20 UTC
From: AKISUJAR@NUSVM.BITNET
Message-ID: <9005090705.AA20892@ucbvax.Berkeley.EDU>
Source record: 241007

Hello from Singapore,

Could any one be kind enough to tell me how can I disable the SCSI parity on the Conner CP3500F, 200MB hard disk. There is no jumper on this one and the drive comes with SCSI parity enabled from factory. On the 100MB Conner, there are 2 pins that I can put the jumper on to disable SCSI parity.

ICD host adapter requires the Hard disk with SCSI disabled. Is it possible to modify the ICD card to accept the SCSI parity enabled hard disk?

Any advise would be most appreciated.

I tried to install DC-Desktop and the following happend:
Itstarts all active moduls and instead of launching the desktop,
it simply reboots. I tried it on an extra disk (didn't want to puzzle with
my HD's auto-folder ;-) and without any accessories...
No luck.

The system: 520STM (1 MB) with german TOS 1.4 and SM124. The harddisk
is connected via the c't-omti adaptor, but as I rebooted without it,
I think the problem is elsewhere.

And yes, I did follow the instructions of the .doc-file (especially
concerning the sequence of the programs).

]I find that the characters become increasingly dim, eventually
]becoming illegible; most especially when the screen is almost
]entirely black already. Has anyone else found this/got a
]solution ?.
I have it, too.
The solution is quite simple. You only need a 20k-potentiometer and solder
it parallel to a condensator. As I don't have the curcuit-map of the monitor
handy at the moment, I can't tell you which one it was, though.
This patch was sent to me by Volker Brandt from Bonn (vbrandt@dbnuama1.bitnet,
I don't know if he still has this account, I only remember dimly there
changed something). Volker, if you are still around, can you tell which
condensator it was?

Greetings,
RIPLEY

Disclaimer: I still haven't installed this (sigh). I can't guarantee, that
it works.

Well, right, the first readme file that I sent to some friends who needed
a patched POOLFIX version was a bit provocative. I've changed that
meanwhile, and I apologized for allowing Chris overhastedly to post it.
Maybe you would understand my attitude in the readme file if you know
how you feel like after an evening of disassembling and patching a
foreign program in order to solve a SEP (somebody else's problem) which
ATARI should have known about and cared for for a long time.
(Remember: The bug has been reported! BTW: It isn't the only bug
in the pool manager, but this is another story and we're currently
trying to find out more about it.)

Alas, if you could read some of my articles in German ST magazines or
my book, you wouldn't have been very surprised to find unusual readmes
from me. My readers seem to like it, and so far nobody really did mind.

Allan Pratt's message that I've seen didn't mention the readme file,
so it seems he wasn't particularly upset because of this. His point
was different: Publishing the program as POOLFIX4, and failing to ask
before. I really do regret doing this, and I hope Allan will someday
forgive me. But on the other hand, there's a real demand for patches
and programs like this, and we're fed up with waiting for ATARI to
do it for us in Germany. We have learnt a lesson: Don't wait for ATARI
to fix it, fix it yourself. This is a main reason why ATARI is so
successful over here: They are supported by their users. It should
be the other way round, though.

Don't forget this is a personal opinion derived from a 4-years-experience
with the ST and ATARI; others will disagree or have experienced much more
feedback from ATARI. Maybe I'm the only one who feels a lack of support.

I hope that Allan will come up with his own POOLFIX4 version and end
this discussion.

First try to disable your AUTO folder programs and ACCs and see what happens.
Nobody here can detect the problem when you've installed so many programs
that might interfere with each other. Do some testing, then let us know.

In article <1124@bambam.UUCP> mcallist@bambam.UUCP (Steve McAllister) writes:
]The Vault and The Key are both great. I lost my hard drive, complete with
I agree. There are only two minor problems which hit me:

Copying the auto-folder results in (sort of) garbage. The files each
for itself ar OK, sure, but they're resorted afterwards.
Well, I used tar and compress and all went fine. ;-)
(Zoo and arc did no good. Either I invoke them for each file again, then
they're sorted in when copying the rest of the archive around. If I do
"zoo -a archive *" from within gulam, they're sorted. If I do "zoo -a
archiv '*'", zoo sorts the filenames itself. Arc reacted this way, too.
What also worked was using the MT C-Shell and doing "ls -u1 | zoo aI archive"
thus listing the contents of auto without sorting and each entry on its
own line and piping these into zoo, reading filenames from stdin.)

The other one: empty directories aren't backup'ed and therefore aren't
copied back. I do have some directories which are essential, though empty
most of the time (you know things like /usr/spool/uucp, don't you? ;-)
Well, I did a "du c d e f g > dirlist" and manually edited the logfile
to a gulam-script to mkdir all missing directories.

Of course you can run external Programs out of Uniterm.
Just increase the System Memory in the Buffers Dialog(SETTINGS->BUFFERS-...)
and you will see, that most Programs, you need can be started...
I used to use Z-Modem....

ALL
====
By the way: does anyone has a real nice working Z-Modem?
I only have the Version which waits every 1024 Byte Block for the receiver
to ACK... If you are sending Files from an UNIX-Maschine, you will see,
that you get mostly an undisturbed Datastream... Should anyone out there
has a Version, which does that in just both Ways ST->UNIX UNIX->ST, then
send me a note....

Greetings

4160. Lanier and Quark HDs on the ST?

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 13:19:23 UTC
From: PHB100@psuvm.psu.edu
Message-ID: <90129.091923PHB100@psuvm.psu.edu>
Source record: 241018

Greetings and salutations,

I recently bought a used Lanier word processor system (for the hard drive) and a used Quark QC10 10 MByte hard drive (for appleII/III/macintosh systems). I bought these on spec hoping I could hook either one of them up to my ST.

The Lanier has "ST506" stamped on the side of the HD mechanism. I've been told that this is useable with the ST, but that is all I know about it (I don't even know how big it is...:). The Quark I've not had apart yet (perhaps tonite), but it has 2 3-position rocker switches on the back which are used to select which apple computer it hooks up to.

Does anyone know if either of these could be used with my 520 ST (upgraded to 1 Meg, color monitor, dual double sided floppies)? Someone told me that I would have to get a host adapter and plug the drive mech into that. True? False? Maybe? Being a poor and struggling college student, I would prefer to go with the cheapest solution possible. :)

If you don't feel this warrants a posting, please feel free email me directly at this account.

Thanx in advance for any and all replies...

Source record: 241191

Open answer to:
Howard C. Johson
hcj@lzsc.att.com

Re:Re: N_SYSCOM.ACC

I developed and updated this program. So about the three criticisms:

>1. Do not clear the screen at startup. An ACC loads after other programs
> in the AUTO folder and I like to see what they have to say.

The 1.1 version DID clear the screen at startup. HOWEVER: as soon as GEM
is started the screen is cleared! The fact that this program has to be
started as an accessory means that the screen is already cleared for me.
The 1.2 version does not clear the screen, so you will be able to see the
information from other accessories (and only from them ...).

>2. A means to slow the display and/or log the system calls is really needed.
> As it is now, there is just a blur. Pretty, but not useful.

The fact that it is a blur means that your Atari is working and working ...
I am sorry that your computer is that fast. Slowing the display down (i.e.
holding the information but not interfering with the computer speed) is
not a wise thing to do, because all you get is an abstract of the executed
commands: you're loosing the sequence. So all I can offer is slowing the
computer down. I hate to do that (finally able to buy a nice ST and then
slowing the thing down to IBM compatibility ...). But I'm afraid that's
the only way to do it. So version 1.2 has the ability to slow your ST down
in 2 ways ('Much' and 'Little'). I do not have the intention at this moment
to make something like a log file. This software (merely meant as a
gimmick ...) would then become too professional ...

>3. Did you purposfully scramble the letters in the ASCII strings? It sure
> makes simple fixes a pain.

Well, why should I? This was due to a tiny little buggy: instead of adding
extending d0.b to d0.w before adding d0 to a0 I added d0.b: the other byte
contained garbage every now and then, which led to a pointer to somewhere
in memory, where there was 'garbage'. I never had this problem, because
I am using N_SYSTEM.ACC (a multipurpose accessory) all of the time, and
that one clears d0 in its VBL routine, so adding d0.b to a0 causes no
problem. This has been fixed in version 1.2: NOW available at your
local (?) panarthea.

I am always open to suggestions and criticism; version 1.2 is mainly
based upon other peoples wishes!

4163. WHERE IS PINHEAD????????

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 14:54:28 UTC
From: SA44@liverpool.ac.UK
Message-ID: <9005092019.AA06214@Argus.Stanford.EDU>
Source record: 241192

Does anyone know where I can get pinhead from???????
I've looked on terminator but can't find it.
Clearing my 2.5M everytime is becoming a pain. I've fixed most
programs with a little cruncher I wrote a while back. (I know it was
crap but it does have one use)
It seems that GEMDOS doesn't clear the memory if a program has no
relocation data (last word in GEMDOS header == FFFF)
My little cruncher tacks some code on that uncompresses the original.
This code doesn't need relocating so a crunched program runs
instantly it is loaded. I use this to speed up most programs, but a
few don't like to be crunched.
BTW using my cruncher after PACK2 usually knocks off a further 1 or 2K
!!!!!! Not much but it saves the space that the uncruching code uses
and I get speedy execution for less disk space.

>Dave Baggett
>dmb@wam.umd.edu

I think everyone is missing the major problem with the poolfix4. The choice of "poolfix4" implies that it is the next version of "poolfix3" and since poolfix3 came from Atari, people will assume poolfix4 also came from Atari. I'm sure that some people would be confused by this and go to Alan Pratt for support/questions/whatever... I don't think it matters how pompous and obnoxious the original post was. If the original name was "POOLPTCH" or something like that, I bet nobody would have complained at all (unless of course it didn't work).

4165. Professional GEM

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 15:49:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9005110726.AA02663@ucbvax.Berkeley.EDU>
Source record: 241193

If you can't access Terminator, Tim Oren's GEM articles are available from the Lancaster PD server.

This is a UNIX machine at Lancaster University, UK and its JANET numerical address is 000010403000 (UK.AC.LANCS.PD, I think). Although it's a UNIX machine, it runs a hybrid shell that will accept most popular commands. The ST stuff is kept in micros/atari, with a full index in micros/atari/index

You can pull stuff across to your own site via FTP.

Hope this helps,

Regards,
Mathew

(Mathew Lodge; JANET: SOCS18@uk.ac.york.vaxa)

4166. ST World (UK)

Message-ID: <9005110727.AA02704@ucbvax.Berkeley.EDU>
Source record: 241195

If you're not interested in UK computer magazines, and ST World in particular, then press n now.

Regular readers of comp.sys.atari.st may recall that ST World (UK) and Europress (ST User) recently merged to form Interactive Publishing, and I suggested that it wouldn't be long before things changed...

Today I received a letter from Interactive publishing, together with the Programmer's Clinic that I submitted at the end of last month. The letter says that:

"Both ST World and Atari ST User are now produced by the same editorial team.. ..the magazines are to be relaunched with a brand new look.

"One of the changes being made... ...is the transfer of your Programmer's Clinic feature from the pages of ST World onto the Cover Disk of Atari ST User. The Cover Disk will contain its own magazine..."

I'm not very happy with the way they've cut and changed the last clinic to fit on the cover disk. I can understand the desire for a smaller clinic, but it's just the way they've changed the article, and the fact that they didn't consult me.

ST World will now be quarterly, and "more of a buyers guide". I don't know what will happen to subscribers to ST World, given that they've now got a subscription to a totally different magazine.

Regards,

Mathew Lodge

Message-ID: <9005091713.aa01761@pooh.Cs.Bham.AC.UK>
Source record: 241196

A recent post mentioned that the PT must be fairly high up in the AES code, possibly when the AES interacts with the IKBD. Well... I definitely get the PT *a lot* whilst in Spectre (any version) - noticeably in HyperCard and THINK C 4.0 (I don't type many "'s anywhere else).

It mostly strikes when I type a ", which for the UK is Shift-2. I don't press two keys quickly or anything, but I've got into the habit now of pressing ", checking the screen, and then hitting Backspace a couple of times :-(.

This clears GEM, it seems to me (it's quite a good scapegoat for general wierdness on the ST though). The problem *must* be in the IKBD - someone mentioned a bug with two keys in the IKBD buffer getting repeated (Claus Brod?) - so obviously the 6301 firmware has been disassembled. Are any more bugs visible in it?

Message-ID: <1318@salyko.cube.sub.org>
Source record: 241197

Well,

I am some normal-average user, who doesn't know very much about programming the st and internal codes...
But I gotta d something to Claus Brods mail: I support these kind of guys, who spend their time and invest a lot of work to patch some errors of all the original atari programms - where would I bee without them?

As far as I can see, Atari really invest their main programmer-power in developping the TT, means, there are all the problems with the TOS 1.4 bugs and so on and on and on...

So, I, as buyer of SM124, Mega2, megafile 30 (other words: all original atari products) and maybe more hardware in future count on these guys, who improve and patch all the original code. And even if you have to admit, you're not the best, if a user from germany sends you correction and improvments of your programm, it would be a great achievement, if you were prepeared for coorperation, if you worked together with them.

Why not? In the end, it's more success for you and the company, if you allow spreading some patched versions of your programms and if you check them out and support them, then it would be if you prohibit them and don't get some reliable versions out...

Well, I hope you got some of my thoughts and messages, although my english needs a drasticall improvement...more than TOS needs...

greetings

ST Penpals List

For those of you who have not heard, there is now a Snail mail list of ST enthusiasts available. This list is especially useful for those of us who have, or or soon will have, *NO* Email access (Final year students). To join the list all you need to do is send me your full name, Snail mail contact address, a list of your areas of interest and optionally upto five lines by 70 characters of free form text about yourself or any other topic you wish. To join or find out more contact me at the address below (use Snail mail or Email) and I will get back to you. This is a worthwhile cause and it's in your interests to join (I get nothing out of this) and it's free! No information passed to me is sold to commercial organisations!

| Simon Chappell, B.Sc(Hons) Computing and Informatics (Final Year)

4171. Archive-related questions

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 18:46:48 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990May9.184648.21657@chinet.chi.il.us>
Source record: 241027

Two questions:
At chinet, the introductory postings and the descriptions of files in the panarthea archive got cancelled about a day after they appeared. Did this happen net-wide? Should it have happened?

There was some talk about 6 months back of re-instituting a mail server at terminator. I would be grateful for an update on this (even a 'we decided not to after all'). It seems that the key sites for Atari ST stuff are panarthea, terminator and dsrgsun; the overlap isn't anything like total, and two of them are accessible only by ftp.

This brings up: for a while there, I was able to have things sent to me by bitftp@pucc.BITNET. It doesn't work any more. Information about any parallel servers, or offers of help untangling bitnet-to-usenet mail would be welcome.

Steve J.

> ...

Ok. I will volunteer. I don't have a lot of free time but I can dedicate
a constant amount each week to it. What I expect to happen is I will get a
lot of contributions and it will take a month or two to get the first version
made. Then I will send a copy to each volunteer to review. After that I will
post something once a month that will indicate where to find the file/files
and how to use them.

Here is what you should do:

a) Ignore this message and wait a few months for this to come together
or die a horrible death.

b) Send me contributions. It can be as small as you want or as big
as you want, C-code or text describing whatever. All submissions
should be Public Domain or Free use if author's name remains in
comments. I will not accept anything that is copywrited, shareware
or has any 'catches' except for inclusion of the submitter's name.
When you make your submission let me know if you want to be a
reviewer of the document before it gets posted.

I would like source code for working GEM programs even if you don't
want the code itself posted. I would like some example GEM programs
to play with. Simple or complex. When you send in stuff keep in
mind I am a c-hacker by trade but I have a very limited knowledge of
Atari internals.

On another note. A few months ago I posted asking if there was any
interest in a GCR mailing list. I recieved 1 reply. I am still willing
to run one if I get enough people on the list.

dav@dartmouth.edu

4173. Splitting comp.sys.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 19:01:56 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9005110715.AA02059@ucbvax.Berkeley.EDU>
Source record: 241004

On the subject of the proposed split of the comp.sys.atari.st newsgroup
I vote against!

Whilst I can see the points made by Mr Baggett I think that there is more
to be gained from pulling the troublemakers into line, than by casting off
from them! We need everyone we can get in this world, we ST owners are
not so numerous that we can ignore half of our retinue! Besides, how do
you define an expert? I am expert at some things, yet at others I am so
embarrisingly inept that they wont let me near their computer! So, am I
an expert or clutz??

I have learnt so much from reading this newsgroup for the last two years
that possibly I will never feel that I have repaid the debt! This is part
of the reason that I started the ST Penpals List! (Had to mention that :-)
I think that reading the words of the wise has done me good, and as for the
many flame wars, well, even though they were a bit hostile at times, it
should be remembered that most of the topics covered were valid, even
if their presentation lacked that certain something!

I think that we should make a concerted effort to bring the bad guys into line
before we lock ourselves in a little world where only experts can come in!
This is not the way forard. I feel that the new monthly posting of the
"Welcome to c.s.a.s" should help greatly, from what I have seen in the first
issue, it covers very important topics (Bomd errors etc) of technical
interest, but also the equally important topic of net manners. We all have
to live along side each other in this big wide world, so the sooner we
learn how, the better! When I was a little sproglet, I used to go around
bashing anyone who didn't have the same computer/cpu/anything else as me,
looking back I realise that this made me a fool rather than a wise man!
Everyone should grow up eventually, and it is our job to help them.

There, I think that I have wandered around the point that I was trying to make
and possibly even arrived at what I meant to say! Sorry about the length
though, oh well, at least it isn't pages of quotes, like some messages
I can think of!!!!!!!!!!!!

4176. Uniterm/Tektronix 4100 terminal emulator

Newsgroup: comp.sys.atari.st
Date: 1990-05-09 19:16:11 UTC
From: ashwin@gatech.edu
Message-ID: <19931@mephisto.UUCP>
Source record: 241015

Hi... I'm a long-time user of UNITERM but I've been a little behind on
upgrades. What is the latest version available?

I now need a Tektronix 4100 terminal (actually, anything in the 410x or 420x
series). Does UNITERM emulate any of these terminals, and if not, would it
be possible to add these without much trouble? I'd imagine it would only be
a matter of adding the escape sequences to UNITERM's database.

Are there other Tektronix emulators available for a monochrome Atari ST?

If some version of UNITERM (or some other program) handles 410x or 420x,
could you either mail it to me or tell me where I can get it from?

Thanks a lot,

Just wanted all of you to know that on terminator.cc.umich.edu
in atari/telecomm is a file called stterm.arc

For those of you who got it personally from me, this is the same
file.

For those of you who arelooking for a decent ST program which supports
zmodem, this is it! I am very happy with it, even though it is
a .tos program (as opposed to gem), and have been using it for
the last 3 years (and still have no desire to change).

And to anyone who is wondering - it was written by Matt Singer of
Comnet systems, same people who put out forem-st, and I got permission
from the author to distribute it.

4181. Conflict between Hard Disk Driver and Click

Newsgroup: comp.sys.atari.st
Date: 1990-05-10 05:11:40 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May10.051140.9289@wam.umd.edu>
Source record: 241028

There seems to be a conflict between Supra's hard disk driver and Digital Keyclick. Booting a hard drive with only the Supra driver and click.prg in the AUTO folder causes click to run without printing an error message, but also without playing the samples. (So I am told by a frustrated user.)

Can anyone think of a reason why a hard disk driver would interfere with trap #13 (bios)? The only way click.prg could be installed but not play the samples is if

A) Something is blowing away trap #13 or preempting click
B) Something is messing with the CONTERM variable (specifically, clearing the high bit).

Anyone have any clues here? I've fixed the drive light problem; it would be real nice if I could get this thing working with the Supra driver before I release it again.

Anyone else have any problems getting click.prg or beep.prg to work?

Those of you who are running these successfully: could you send me a quick note describing your system configuration (including TOS version)?

Sorry to beta test on you guys, but I guess that's the price you pay for getting it first...

Thanks a lot,

Dave Baggett

4182. How do I create metafiles? Where is Tim Oren's complete series?

Newsgroup: comp.sys.atari.st
Date: 1990-05-10 05:42:10 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <2648FF33.3380@maccs.dcss.mcmaster.ca>
Source record: 241021

Greetings fellow netlanders.

I have 2 questions tonight:

1. I want to know how to create metafiles that could be printed out with programs like OUTPRINT.PRG. I'm a bit at a loss here and I would greatly appreciate some help. Some sample source in Personal Pascal or C would do nicely, if available. Does GDOS have to be loaded in order to do this? Are there bindings for functions like vm_pagesize() etc or do I have to make them up myself? What has to be put into the intin[] and ptsin[] arrays? Are work stations possible on the ST or do I have to stay with virtual workstations? Is that the way it is done? These are some of the questions I have been asking myself.

2. Tim Oren wrote a series of articles on GEM programming on the ST. I saw the list on a BBS that has since lost their files and I cannot get at the series any longer. There were around 18-20 articles. However, I can only find the first 11 on the ftp sites that I looked at. Where are the rest of them? Do that many actually exist or is it just something I'm dreaming about?

If there is any interest and if I can put something together that actually works, I'll post some sample source here.

Thanks for any help.

Does anyone have a copy of ST-Term (latest version 3.6?) that they could mail to me? I've been told by several people that it has a good implementation of Zmodem.

If you don't have a copy, but know of which online service which does (CIS, GEnie, Delphi, etc.), please pipe up so I can grab it myself or convince someone I know to. :-)

Thanks a bunch.

P.S. To: S. Alan Ezust, thanks for the offer of sending ST-Term to me. I tried to mail you back but the message bounced even though I tried four different routes! If you see this, please do mail me ST-Term. Thanks!

>>CU Carsten.
>>Smalltalk-80 from ParcPlaceSystems at Georg Heeg at Unido.
>>I do not know, whether he is allowed to distribute it outside Germany.

You see,Atari ST is quite good used in Germany! Atari-US really should look
at TURBO-C to produce the TOS. With the release 2.0 of this compiler, one
can produce absolute-code!

With ST-80: you just can get version 2.3 from them. Objectworks is not
supported and will not be in the future (so said at the CEBIT), because
it needs so much memory, that even a Mega-ST4 will not satisfy it. Never
version will be supported, when ParcPlace releases better Memory-Manager.

Perhaps they will port Objectworks to the TT...

V2.3 works with the big screens from Matrix and (sometimes with a little patch)
from Atari. The performance of the implementation:

Standard-ST-Benchmarks: 40-42
with Hypercache (16 MHZ Accelerator): 70

Quite good for this lovely machine. With a 386-machine, 20 MHZ, I could get
with Objectworks V2.5 just an Index of 102.

4188. Re: Lanier and Quark HDs on the ST?

Newsgroup: comp.sys.atari.st
Date: 1990-05-10 09:43:09 UTC
From: brianp@ernie.Berkeley.EDU
Message-ID: <36178@ucbvax.BERKELEY.EDU>
Source record: 241039

In article <90129.091923PHB100@psuvm.psu.edu> PHB100@psuvm.psu.edu writes:
-> I recently bought a used Lanier word processor system (for the hard drive)
->and a used Quark QC10 10 MByte hard drive (for appleII/III/macintosh systems).
->I bought these on spec hoping I could hook either one of them up to my ST.
...

[*** some intervening site confounded my "R"eply, thus, I "F"ollowup... ***]

In article <90129.091923PHB100@psuvm.psu.edu> you write:
->The Lanier has "ST506" stamped on the side of the HD mechanism. I've been tol
->that this is useable with the ST, but that is all I know about it (I don't eve
->know how big it is...:). The Quark I've not had apart yet (perhaps tonite),

Yes, it is useable. You need more stuff, though.
First, the Atari DMA port is not QUITE standard. Its format is called
"ACSI" (stands for something or other). You need to have a board to
convert that to SCSI (small computer standard interface, or so).
SCSI is a standard for the electrical connection between devices,
(such as computers and drives), and for the format of data that goes
thru. There can be 8 (I think) SCSI devices all hooked together on a bus.
They each have their own number.
Second, you need to have a hard drive controller board. It is one of
those SCSI devices. It will have jumpers, dip switches, or whatever
to set the SCSI number. It takes the SCSI info, and translates it into
ST506 (if it's an ST506 controller, of course). It tells the ST506 drive
what to do, stuff like moving its heads and stuff, I think.
Some controllers can have two drives connected to them, as part of the
same SCSI device.
Third, you need a power supply for the ACSI->SCSI, the controller, and
the hard drive. It has I think 12 and 5 volts, ground, and maybe a negative
also.
Fourth, you need a fan, in case all that hardware gets warm.
Fifth, you need some sort of box for all that stuff.

I don't know anything about the Quark, You might get a look at the actual
drive mech and see if it also says "ST506", or see what the brand and model
is, and look up the type. Maybe also there is a SCSI controller in it, too.

->have to get a host adapter and plug the drive mech into that. True? False?
->Maybe? Being a poor and struggling college student, I would prefer to go with
->the cheapest solution possible. :)

There is a company called Berkeley Micro Systems which makes the converter
board, and also sticks it into a kit with a controller and all the other
stuff. You supply the actual hard drive, and plug it all together.
I happen to live nearby, and walked my drive over there and came back

with a working hard disk drive package. They also fixed something when it went kafooey.
The converter was a hundred something, also the controller. You might have power supplies and boxes and fans with the stuff you got. You might even have a controller or two for the ST506 drive(s?).

I don't really know much about the controllers, but maybe someone else has sent you a bunch of info, too. Here's a phone # and address (possibly current):
Berkeley Microsystems
P.O. Box 20119
Oakland, CA 94620
(415) 465 6956

Good luck!
Brian

Right, you can use a ST506 drive with your ST, but you'll have to get a
host adapter which translates the ATARI ACSI bus (DMA port) to SCSI and
a controller which translates SCSI to ST506. ACSI-SCSI host adapters
are available in all flavors. ICD makes good host adapters. You might
want to use a Adaptec 4000A SCSI-ST506 controller; this is the same
controller as in the SH205 or SH204. If you're lucky, you'll find someone
with an old SH204 and use the parts in there. This might be as simple
as plugging the old drive out and plugging yours in. You can also use
two ST506 drives with the Adaptec in a SH204/5, but then you're running
into slight problems with power and space (especially in the SH204 or
in the SH205 equipped with a 5.25" drive).

>obnoxious the original post was. If the original name was "POOLPTCH" or
>something like that, I bet nobody would have complained at all (unless of
>course it didn't work).

Right you are, and I've done something about it. The whole thing happened
more or less accidentally: I disassembled POOLFIX3, then transferred the
source into my integrated assembler environment. There I did some patching
and saved it; the file selector suggested naming it 'POOLFIX3'; I didn't
want to overwrite the old version of the text and changed the last letter
from '3' to '4'... that's how the whole thing started. Somehow I forgot
to change the name before sending it to some readers. Yessir, it's my
own stupid fault, and I apologize for that. Everyone who owns POOLFIX4
now is asked to change the name to POOLF_CB or something like that;
please don't blame Allan if there are any problems with it. Hell,
what can I do more to clean up the mess...

It's not quite as easy as in a SH205. There you'll just have to plug
in the new drive, find some room for placing the new drive and retarding
switch-on power for the second drive in order not to bring down the weak power
supply in the SH205.

Does anybody know in which directory I need to put the TFM files for Bammi's Virtex? Whenever I try to load fonts, it tells me that it can't find them, even when I include a pathname. If the default is on F: partition, then I'm out of luck, since I only have partitions through E:. Also, I don't have enough memory to call virtex from a shell, so I can't change the path through environment variables. I have no problem with going into the .ttp file and changing the default pathname with a sector editor, but I haven't had any luck finding the place to change. If anybody has any useful suggestions, I will be eternally grateful.
BTW, Thanks to Bammi for this *incredibly* useful program. Now that I have the new showdvi.prg that will work in color, I can really have fun!

Boy, when you start commenting your own messages you know you badly need
a break. I forgot to say what to do to a Megafile 30/60 when putting a second
drive in it. ATARI has made two slight modifications on the controller
board:

1. Locate the 20-pin-plug for the second drive. Pin 17 has been connected
to grounds via a resistor. Cut the resistor (upper board side).

2. Pin 18 of the same plug has been soldered to grounds, too. Remove
this connection (lower board side).

Claus Brod

PS: For techs: Pin 17 and 18 are +RLL READ and -RLL READ, respectively.

4194. deskjet driver for the mac

Source record: 241034

Hi all,

I have a friend who's planning to buy an HP deskjet, and I
dowloaded a driver so that he'll be able to use it with
Spectre. I found it at ricevm1.bitnet (version 2.1). The
trouble is, we don't know if it's a really good driver,
and if it's really better than his Nec 24-pin printer . Does
anybody here use the same hardware/software combination ?
I remember having read some messages about this here. Do graphics
and letters look 'as good' as on a laser printer ? Does it
have a reasonable speed ?
The help file that came with the driver was badly corrupted,
even if decoding it didn't show any problem. Does anybody
have a good one ?
Thanks for any information,

Eric

Message-ID: <90May10.085812edt.57432@ugw.utcs.utoronto.ca>
Source record: 241035

I want to get a Toadfile 88 (dual SyQuest 44 meg disks) to:

1. use with my 1040ST and Mega 2

2. back up SyQuest disks from an AT

3. back up internal hard disks on Mac SEs

Number 2 should be straightforward as the ST should consider the AT disk info as native ST info. However, I am unsure if the Toadfile can be connected to a Mac from the SCSI port on the drive. Do I have to disconnect the ICD host adapter? Is there any special cable needed?

Toad Computers said they had no experience with using their Toadfile drives on a Mac and could not help me out. Dave Small, are you out there and can you answer this one? Anyone else?

4197. ST hard/soft emulator for IBM

Newsgroup: comp.sys.atari.st

Message-ID: <1331@psc90.UUCP>
Source record: 241036

Hello out there in net land,

I was recently reading ST-Informer and came across an article about a board and software for the IBM which is a full blown ST, and allows you to turn your IBM into and ST. Unfortunately it was a very vague article and I would like to get more info. Firstly are there any requirements on the IBM end, for example EGA or better graphics display? Who makes this mysterious little device, I think it said in the article but I forgot the name, and when will it actually be ready. Any info at all would be great, I'm very interested in this as I used to own an ST and enjoyed it very much.

4198. Re: prtblk?

Newsgroup: comp.sys.atari.st
Date: 1990-05-10 13:26:49 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <26496C19.6496@maccs.dcss.mcmaster.ca>
Source record: 241038

This is what Atari ST Internals from Abacus says about Prtblk.

C: void Prtblk(parameter)
long paramter;

Assembler:
move.l parameter,-(sp)
move.w #36,-(sp)
trap #14
addq.l #6,sp

This function resembles and is used by the function Scrdmp (20). The function expects a paramter list, however, whose address is passed to it. This list is constructed as follows:

long blkprt Address of the screen RAM
int offset
int width Screen width
int height Screen height
int left
int right
int scrres Screen resolution (0, 1, or 2)
int dstres Printer resolution (0 or 1)
long colpal Address of the color palette
int type Printer type (0-3)
int port Printer port (0=Centronics, 1=RS-232)
long masks Pointer to half-tone mask

Example:
move.l #parameter,-(sp) Address of the parameter block
move.w #36,-(sp) prtplk
trap #14
addq.l #6,sp
...
parameter dc.l ...

Hope this helps.

4203. Unix Window's Kermit

Newsgroup: comp.sys.atari.st
Date: 1990-05-10 18:40:45 UTC
From: icsu8053@caesar.cs.montana.edu
Message-ID: <1761@dali>
Source record: 241047

Has anyone gotten the Kermit file transfer to work inside a Unix window?
It works fine when the uw server is NOT running but Kermit "croaks" (sorry)
after the uw server is started.

I issue the Send or Recieve command from C-Kermit on the Unix side and then
the appropriate Kermit command from Unix windows. Then, nothing happens with
the exception of an occasional timeout message. Has anyone gotten this to
work? This Kermit option excites me. Right now, though, it's pretty boring.
I assume that this is the newest version of Unixwind. I just got it from
Terminator today. Please, ANY and ALL help is appreciated!

Well, I figured this out and, instead of killing the article I figured I should inform the world about this "totally cool" setup. To be short, the trick was to get the new version (4.2) of the Unix Windows server as well. Result: I am, right now, downloading and typing this message pseudo-simultaneously. I HIGHLY recommend this setup! Get it. Use it. It's awesome. I'm sorry if this isn't news to everyone, but it must be to some. The newest version of Unix Windows allows you too execute a child program such as a CLI as well. Unfortunately, downloading does stop when you do this. The slowdown isn't as bad as I thought when downloading either.

Thanks go out to Hans-Martin Mosner, Brad Bosch and Brian Katzung for their excellent adaptation.

Indeed. This also proves for GNU-Smalltalk.

And now, I have to tell you how nice I find ParcPlace
Smalltalk-80, since otherwise I have included more
than I tell you now. And then, the mailing system
would reject this a third time.

I think this is crazy, since I had to include that much
to give the context.

Is it the only HD you have connected to your system? If have more than one HD connected the try disconnecting all of the drives except the one you are trying to get working. I ran into similiar trouble one time with multiple drives (actualy multiple controlers/drives), it's been a while so I don't remember the details but I think it had to do with one drive being formated with old ICD software and the other (the one I was trying to set as bootable) formatted with the newer ICD software (V4.xxx).

OK, Here's some thought provoking stuff:
Easy ones first!

1. How do get hold of stuff like SALAD and the PEXEC Cookbook?

2. Can you call line-a routines from within C? (Sozobon in particular)

3. Can you tap into interupts and have a C routine called x times per second
via a system interupt? In the Abacus internals (3rd ed) there was something
about a list of routine addresses that could be supplied to the VBL interupt,
am I mistaken, or seriously out of my depth here? Obviously this would
allow the start of a multi-tasking system.

4. How much difference is there between GEMFAST 1.2 and 1.3 GEM libraries?
I have the 1.2 is it worthwhile my getting the new stuff?

Thank you for your time.

Regards,

Simon.

4212. ST Controls VCR?

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 02:43:20 UTC
From: mjw06513@uxa.cso.uiuc.edu
Message-ID: <1990May11.024320.15165@ux1.cso.uiuc.edu>
Source record: 240952

I've been told that there is a program for the Atari ST which allows an ST to control a VCR (via the Control-L jack on the back). I believe the program in question used the VCR to record animation output from the computer, but I'm not interested in this specifically. My true goal is to use the computer as a video editing controller.

Does this sound familiar to anyone out there? Where can I obtain a copy of this program (preferably with source code)? It seems to be designed to work with Sony VCRs via the Control-L jack - will it work with other brands as well?

Any pointers or information will be appreciated. Thanks!

|I don't think `uw` is possible without job control.

Uw is possible without job control, but it does require pseudo-ttys.
I ported the BSD host version to a System V system that has the
Wollongong TCP/IP package.

There are some work-arounds for Wollongong implementation details that
make it somewhat painful to use (a port watcher/reader process which
doubles the input overhead and no XON/XOFF support). XON/XOFF support
could be approximated with a trade-off between correctness and overhead,
but I have not done this.

I am not in a position to distribute code, but if there is interest,
send me mail and I will describe briefly what changes are required.

First, you will use "x//" instead of "-x//". Second, to pack a whole directory tree into a .ZOO file you have to type "a//". The original Zoo does not have this but Daan Jitta put it in for the ST version.

In practice, you'd have to design your own MMU that does all the standard
MMU stuff (RAM refreshing, shifter controlling et cetera) plus memory
protection. I wouldn't feel very inclined to do chip designing for
ATARI, would you?

Moreover, controlling a coprocessor with a 68000 isn't quite as
practical as with an 68020/68030. Some people in the US and in
Germany have announced 68030 boards, and the 68030 has a built-in
MMU. This might solve this problem someday. Anyway, you'd have to
port UNIX to the ST - probably you'd be better off waiting for the
TT/UNIX.

It wasn't me mentioning a IKBD buffer bug. There has been a series
of articles on the IKBD in the German "ST-Computer" by someone who
really disassembled the IKBD ROM stuff. Maybe I'll ask him to come
to our rescue. Have there been any comment from ATARI to this
question? I can't believe nobody at ATARI ever experienced it.

I remember someone posted a msg and supposing that the bug was
probably due to sync problems between the IKBD and the TOS keyboard
interrupt routines; this might be a solution. Dave Small or some
other Spectre programmer: Does Spectre use internal TOS routines,
i.e. does it call BIOS or XBIOS routines or does it use the TOS
IKBD routines or does it talk to the IKBD directly? If we knew,
we could perhaps settle the question whether it's a low-level TOS bug
or a IKBD bug.

>2. Can you call line-a routines from within C? (Sozobon in particular)

I don't own Sozobon C, but yes, you can call LINE-A from C. No prob.
But remember: ATARI won't support LINE-A for the new TT resolutions
officially. The first TT developper machines, however, have LINE_A
for all of their resolutions, but you can't rely on it in the future.
Unfortunately, one sometimes needs the negative LINE-A variable, and
I hope ATARI will support them in the future.

>3. Can you tap into interupts and have a C routine called x times per second
> via a system interupt? In the Abacus internals (3rd ed) there was something
> about a list of routine addresses that could be supplied to the VBL interupt,
Yes you can have C interrupt routines. But remember: VBL interrupt routines
have to be kept fast, so you should do it in assembler. However, nobody
prevents you from placing a pointer to one of your C routines into the
VBL queue. Remember to first find out the number of VBL tasks already
installed (look at $454) and to locate the VBL queue (look at $456).
Don't assume that the VBL queue resides at $4ce! Remember that GEM
overwrites the first VBL task pointer in the queue during AES start-up,
so if you're writing an AUTO folder program that installs a VBL routine,
start looking for a free entry from the second entry onwards.
.
> allow the start of a multi-tasking system.

Well, you'll need something more than just a bunch of VBL tasks to have
multi-tasking. Besides, you can have non-preemptive multi-tasking using
the AES event manager.

>Am I being stupid or is it really hard to find?

Hi Stefan, fine to meet to you on the net. No, you're not senile, it is really a problem. If you're being started from DESKTOP or GEMINI via shel_write, you'll get your own name via shel_read(). (Hope I didn't mix up some names.) If your program has been called via Pexec without shel_writing the name before, you're out of luck - except if the calling program uses Xarg. Julian, can you help out? I didn't implement Xarg yet.

This means that AUTO folder programs can't get to their names legally because they are being started via Pexec during the start-up process, and since GEM hasn't been initialized in the AUTO folder, the BIOS reset routine can't shel_write the name before, and your program can't shel_read the name. Moreover, the BIOS AUTO folder routine doesn't use those Xarg tricks yet.

>in this as I used to own an ST and enjoyed it very much.

I think you mean the VME ST boards made by proVME in Germany. These are complete STs on a VME board and plug into a VME bus which is probably available for PCs. As far as I know these STs use their own video shifter and have a separate video output to connect an SM124. I think the VME STs were mainly made for engineering purposes in complete VME systems.

No warranty for this information, as I didn't follow the development very closely. Can somebody help?

4225. Tim Oren's Gem articles/ftp/lancaster.pdsoft

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 12:14:08 UTC
From: M.A.Holloway@SYSE.SALFORD.AC.UK
Message-ID: <11.May.90.13
Source record: 240953

There are 13 of Tim Oren's Professional Gem Programming articles at
Lancaster:
The issues currently online cover the following topics:
1. Windows, part 1
2. Windows, part 2
3. The dialog handler
4. GEM resource structure
5. Resource tree structures
6. Raster operations
7. Menu structur
8. User interfaces
9. VDI graphics : lines and solids
10. VDI graphics : text output
11. GEM hooks and hacks
12. GEM events and program structure
13. A new form manager

If you can't FTP these using the JANET/pss FTP address given by Mathew Lodge
then you can use the server at the :
archive-server%uk.ac.lancs.pdsoft@ukacrl (or try @edu.cuny.cunyvm)
To get all the articles send the message:
send micros/atari/m06/*
To get a full list of the commands understood email:
send help/server
There is also mac,amiga and ibm stuff there. There seems to be a lot of
interesting stuff at terminator but can I get to it? I ask as I don't know
anything about anonymous FTP and there doesn't seem to be a server there.
Anyone on JANET: Is it possible to FTP stuff from there?
Thanks in advance for any help offered.

Marc

> I always checked the dates on the atari/new directory also to see if there
> was anything "new" to get. Kind of a bummer that I can't read it now.

> Could the people who run terminator fix this?

One of the difficulties in having a world-writeable, world-readable "new"
directory for uploads is that otherwise, there's virtually no control over
what's uploaded --- and immediately made available for download. Think about
all the fuss that there would be if someone (Hey, with the *very* best
intentions) uploaded some expensive, proprietary and unprotected DTP package
(for example). Having the read bit not set is terminator's only protection.
There are a number of people busy sorting out the terminator archives
(including adding comp.binaries/sources.atari.st volumes). I would imagine that
it won't be all that long before "Readme.new.uploads.received" (or near offer)
will be available, along with "Readme.the.definitive.index".

++ We need everyone we can get in this world, we ST owners are
++ not so numerous that we can ignore half of our retinue!

How true. The UK magazine STWorld --- a "serious" ST-ers mag and unarguably the best on the market, has recently been taken over. Guess what ... Despite the protestations (on a UK-wide BBS) of the editor that everything *really was* going to be OK, STWorld is now to be a **quarterly** magazine and the publisher is putting most of the effort into STUser. STUser is currently about 50% games reviews. Under the new regime, it will be upgraded into a "good" ST mag --- and will "only" have 14 pages of games reviews. I think I can guess the kind of features we will see ...

"How to insert a disk into the disk drive *and* get it right way up",

"BASIC made easy."

"'C' -- an esoteric systems programming language. (includes 'Hello world' demo)"

"GEM revealed: what those strange little window corner symbols are for."

"In-depth technical feature: adding a second floppy disk drive."

ad nauseam.

I am really p****d off about it, a very valuable technical forum relegated to a quarterly (which will last all of two issues) in order to open the market for another B****Y games mag, S**T! S**T!! S**T!!! S**T!!!! (You can tell that I'm upset, can't you?)

Depressedly yours ...

4229. Handbook for Internet users including FTP and Mail services

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 14:06:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9005121027.AA28532@ucbvax.Berkeley.EDU>
Source record: 240990

Now that many of the students who use INFO-ATARI16 are gone for the
summer things have quieted down. It might be a good time to come up with a
handbook that can be distributed by Internet mail to people who ask questions
like:
1)> What is FTP
2)> How do I deal with .zoo files?
3)> Where do I find TeX material?
4)> Where are the FTP sites?
5)> Why am I on the Internet anyway?

Steve Grimm's postings for the UUCP side of things are a wonderful help,
but it would be nice to have something comparable that could be sent out to
people who are trying to use the Internet facilities.

I will be glad to try to coordinate a project for writing such a handbook
if people will send me material and suggestions.

The design goals that I se right now are to get a document that can be
e-mailed to anyone who posts a message that indicates that they are unsure of
what they are doing. The document should be short enough to pass through
most mailers.

If such a document were available it might help novices make good use of
the facilities without having to take up capture buffer space with questions
that get asked over an over again. The contnet of the INFO-ATARI16 digests
might be improved thereby.

Suggestions, comments, and submission should be sent to

JOHNBARNES@ENH.NIST.GOV.

Thank You
John Barnes

4230. 2 SPECTRE QUESTIONS: PARKING A HD AND MEG-A-MINUTE

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 14:40:31 UTC
From: MAXG@SUVM.BITNET
Message-ID: <9005120706.AA22311@ucbvax.Berkeley.EDU>
Source record: 240984

1. Is there some way to park an MFM hard disk in an ICD setup from Spectre mode? or do I have to reboot my system and then use my park program in GEM (as I've been doing)? For that matter, is it really necessary to park the hard disk from Spectre mode? (I'm using v 1.9 to maintain compatibility with Translator1, but I do have v2.65...I don't know if this would make a difference.)
2. I see in the Spectre manual that meg-a-minute was published through Start. Is there anyway to get this program now? i.e. do I have to purchase it from Start (if that is possible), or is it shareware? pd? posted somewhere?
Thanks very much in advance. You can email to me directly, or post to the net.

> OK, Here's some thought provoking stuff:
> Easy ones first!
>
> 1. How do get hold of stuff like SALAD and the PEXEC Cookbook?

So far as I know, the only way is to be a developer. I have not located
an comprehensive+comprehensible Line A document that can be distributed.

Bammi's Line A header file (for C) is available, but it's not a tutorial.

I don't know what's in the Pexec Cookbook.

> 2. Can you call line-a routines from within C? (Sozobon in particular)

Sure. Line A routines don't work with arguments passed on a stack, though.
They're more like GEM -- i.e., you put magic numbers into magic mailboxes
and then wave a magic wand. :-) See Bammi's header file.

Sozobon has an asm() feature for inline assembler that will allow you
to do something like this:

```
char *A000() /* return address of the line A parameter block */
{
asm("dc.w $A000"); /* put illegal opcode A000 into text segment */
}
```

... but it's simpler just to write the calls in assembler. Remember that
Sozobon assembler labels should have a leading underscore in order to make
them visible to C. Example:

```
.globl _A000
_A000:
dc.w $A000 * define constant.word $A000, which is illegal opcode
rts
```

Note: Do not feed these to the Sozobon optimizer.

Some of the $A??? opcodes clobber important registers. I don't know which
ones.

> 3. Can you tap into interupts and have a C routine called x times per second
> via a system interupt? In the Abacus internals (3rd ed) there was something
> about a list of routine addresses that could be supplied to the VBL interupt,
> am I mistaken, or seriously out of my depth here? Obviously this would
> allow the start of a multi-tasking system.

Yes. I don't have any examples, though. I've seen a textfile on the technique; if you're seriously interested I can track it down and mail it to you.

If it's multitasking you're after, why not just use Micro RTX?

> 4. How much difference is there between GEMFAST 1.2 and 1.3 GEM libraries?
> I have the 1.2 is it worthwhile my getting the new stuff?

There are some bugfixes. I think it's worth getting.

From: gheesling@krypton.arc.nasa.gov
Message-ID: <1609@mountn.dec.com>
Source record: 240982

It doesn't matter where the System Folder is. Here's my suggestions:

Be sure Mac partition is the last one on the bus. Check the Spectre menu so that it is set for boot from HD. Be sure you can see the name of the MAC hard di disk from the Spectre menu.

Can you access other files OK once it's booted? Mine works with most System versions.

Bob

4234. Quick CIS

Newsgroup: comp.sys.atari.st

Message-ID: <9005121026.AA28481@ucbvax.Berkeley.EDU>
Source record: 240988

An enquiry was recently posted concerning the Deskjet+ and spectre, I have a few coooments/questions on the matter. I have a DJ+ and am considering spectre so here goes.

i) Certainly the DJ+ is nearer to Laser than it is to 24 pin, its faster, better quality and you dont have problems with 180/180, 360/180, 360/360 dpi choices, It is a great value printer unless you intend your work to be read under water.

ii) As quickdraw scales the screen fonts to the printer you are probably going to do better scaling them from 72 to 300dpi (4 ish times) than you are from 72 to 180 dpi (2.5) though 5x at 360 is a good but SLOW bet.

Questions:

HP has released the deskwriter for the Mac, does this use the same codes as the DJ+, i.e. will a deskwriter driver run the DJ+.

Is there anyone out there running spectre with a DJ+ (or even a real mac).

Finally and almost unrelated, are there any good Mac PD sites I can get to by mail as I cannot FTP except within the U.K. (I know about Lancaster).

Keep up the good work Dave......

Thanks

Source record: 240972

In article <11977@netcom.UUCP> rcb@netcom.uucp (Roy Bixler) writes:
>
>I'm wondering if there are any possibilities of replacing the MMU on the
>ST with one that gives memory protection.

Humm, I`ve often wondered if the current MMU could be used for process memory protection. Imagine a process controler (PC) that starts up after all the accessories have modified that high physical memory limit. Each task that is invoked gets a specfic hunk of memory. The PC knows the high limit imposed by the accessories, the low limit imposed by TOS, and each processes memory area. So instead of leaving the high and low memory limits fixed, make them more restrictive. The PC would set these limits before invoking each task, and would catch the appropriate interrupts when the limits were acrossed in user mode.

Humm,
Eric

4237. X Subset for the ST???

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 17:58:46 UTC
From: Bill_Von_Hagen@TRANSARC.COM
Message-ID: <0aGjpKn0BwwfICZ208@transarc.com>
Source record: 240973

After reading the recent mail about UW port available for the ST, I was wondering if there was a version of X (any subset would do!) available anywhere for the ST? All I really want to do is to be able to connect to a remote system and run an X-based utility from home. (I have both a monochrome and color monitor.) Anyway, the idea seems reasonable to me - I'd hate to buy an X Terminal when I have an ST sitting there, begging to do the job.

While I'm here, what is uw, anyway? I've gleaned its functionality from recent posts, but never heard of it before.

Any tips/pointers/info would be VERY MUCH appreciated!!!!

Thanks!

4239. Linker formats

Newsgroup: comp.sys.atari.st
Date: 1990-05-11 18:13:00 UTC
From: SOCS18@vaxa.york.ac.UK
Message-ID: <9005120709.AA22452@ucbvax.Berkeley.EDU>
Source record: 240987

The GST linker format is well described in the manual for Metacomco's Macro Assembler Version 12.0. Now Metacomco have left the ST market (the company was shut down by one of its senior partners because he needed the money for his expanding hotel business!), so you might find the assembler going cheap somewhere.

Not much of a solution, I know, but it's the only place I've ever seen the GST format documented.

From: dbrooks@osf.org
Message-ID: <7973@paperboy.OSF.ORG>
Source record: 240974

I finally got a 2-sided drive when my old 1-sided went back home. My dealer sold me a:

MASTER 3S drive from Konyo International

which is said to have a TEAC mechanism.

Prolem it, it doesn't seem to detect media change. I take out a write-enabled floppy, put in another, hit escape in the GEM directory: nothing moves. As far as I remember, this means the drive isn't setting "write-protect" during the transition.

(a) Does anyone know this drive: is it a design flaw or a bad unit?

(b) Assuming I can stand closing and reopening the window, will anything else go badly wrong? In particular, should I beware software disk caches?

Source record: 240985

Hello chums,

We have just got Neodesk 2.05 here (5 months after we ordered it, thanks, Electric Distribution Ltd!) and we love it with deep and abiding passion.

Today however it refused to work (2 bombs trying to do anything from Neodesk, including quitting) and after a little fiddling I found that it didn't like copyfix.prg, which came with our HD (ICD adaptor). Well, I now know, having read the manual, that Neodesk solves that bug itself, but I thought I'd ask...

a) Any suggestions as to why the system ran all right yesterday, but died today, when as far as we know nothing was changed, and

b) If there are any programs notoriously incompatible with Neodesk, which we and other Neodesk virgins out there could be warned not to try in advance and

c) Why Atari don't buy it , blow it into the ROMS and blow the socks off the old desktop (Don't worry A.P., I don't really want an answer, this is rhetorical)

Love and kisses,

Jan Ameij and the boys,

Message-ID: <702@zinn.MV.COM>
Source record: 240904

J. David Beutel suggests that an index file could be made available
for the archive of examles (and other useful things, he points out),
such that a well-known request could cause it to be mailed to the
requester, who could then search it using 'grep' or equivalent.

Another way to do this would be to store the examples (etc) as 'blobs'
in a relational database, indexed by things like related hardware,
system calls names, related software, language, submission date, author,
arbitrarily-assigned keywords, whatever. The the requesting mail msg
could contain a relational expression specifying the thing to retrieve
and mail back. e.g. (using (ugh!) SQL) WHERE HARDWARE == 'DISK' AND
SYSCALL == 'BIOS' AND KEYWORD LIKE '%FORMAT%'

From: kgg@zinn.MV.COM
Message-ID: <704@zinn.MV.COM>
Source record: 240905

A year or so I came into possession of a copy of UUPC for the ST,
where UUPC is an implementation of UUCP (originally-) for the IBM PC.
It explained itself as a *very* early version, what might be called
"pre-alpha release" of the Atari port, mentioning that the author
had essentially been harassed into releasing it "before its time".
I don't have the details in front of me at the moment, but some of
the names asociated with it were Stuart Lynne, Steven Grimm, and
Lawrence Harris. I mention these names not to get them in trouble,
nor in hopes that anyone will hunt them down, but only to help
identify this package to other readers who have it.

It sounded like things were going great guns. What happened?
I got my copy running (more or less) under Mark Williams MicroShell.
I seem to have a problem that mail messages I send from the ST
have <RETURN>s in them, which confuses mailers on Unix boxes,
but I can receive mail okay. Also, the mail utility itself is rather
primitive. In spite of these problems, the package seems promising,
so I'd like to find newer versions that might fix these problems.
Anybody know what happened to this project, or where I can get newer
versions?

Failing that, does anyone know of another implementation of UUCP for
the ST that they could recommend, and where to obtain it?

(In the addresses below, "rr" is my ST, "zinn" is my UUCP partner,
where I also have a guest account.)

TIA,

Ref: Toad File 88

Hello from Singapore,

Do you really want to own 2 Syquest Removable Hard disks?
I am now using the Megafile 44 (one Syquest) I think that it is already more than I can handle. I have 4 cartridges one each for SperCharger (MsDos format), Atari format, Spectre format and Macintosh format. When I want to connect it to Macintosh I just disconnect the Syquest from the Atari Host adapter card and connect the drive with home made cable as explained in the Spectre Manual.
I also have ICD card. with ICD host adapter card you can make a cable with the 50 pin sockets to connect Syquest and ICD card and have one end of the ribbon extended to connect to DB25 Pin for connection to Mac SCSI port. When you want to use the Drive with Mac, Just unplug or switchoff the 5V supply to the ICD card. I use CMS HD util version 5.2.2 to format in Mac mode. The mac cartridge can also read and write under Spectre. I mentioned one Syquest is more than enough for me because after 3 months with Megafile 44 I have lost several parti tions of my cartridges. I will definitely install 2nd Hard disk inside the Mega file 44 and use Syquest only for backing up. If you think of backing up a cart- ridge with another one, I came across discussion in INFO-APPLEII mentioned about a program (for Apple IIgs) which can perform cartridge to cartridge copy with one Syquest drive. However I have not yet come across such a program for Atari.
My problem now is to disable SCSI parity on my Conner CP3200F, 200MB drive so I can install it in the Magafile 44 box.

If you want to know more about my experience with Syquest 44 you can e-mail me. There are more detail which wont be of much interest to other netter that I can tell you.

Hope this help,

S. Sujarittanonta, School of Architecture, National University of Singapore,
AKISUJAR@NUSVM.BITNET

Huh? How do things like FOLDRXXX.PRG get their name then? In fact, I
wrote a utility several years ago so support RAM disks that ran from the
AUTO folder and read its own name to find out what to do. I don't
remember how the code worked, although I probably still have the source
around somewhere, but it was written in TDI Modula-2 and reading the
name of the program seemed straghtforward.

>It doesn't matter where the System Folder is. Here's my suggestions:

I received several replies to my request for help (how to get a GCR to autoboot). The correct response came from the President of the local Mac user group (Peter Gergely of MUGNS) who told me to do the following:

Drag the System and Folder together onto the HD icon (NOT onto the desktop). They then appear on the desktop. This apparently moves their directory entries into the boot area.

Drag them back into the System folder. The Mac screen looks just the way it did when you started.

The system now autoboots (assuming that you have followed all the other instructions in the manual about setting the proper Spectre options, which I had done).

Re the merger of ST World and Atari ST User, I hope that something worthwhile rises from the ashes, but somehow I doubt it... I only ever bought ST World because the content interested me - the heavy games bias of ST User interests me not one whit. Now that it sounds as though ST World is to be emasculated, I suspect I'm not going to buy either in future...

There seems to be a growing dearth of good ST mags on the market - the US mag START is getting more flimsy with every issue, and I suspect is not long for this earth. The only decent mags appear to come from Germany, but since I can't read German, this ain't much good to me.

What's a girl to do??...

4255. Determining Own Name

Newsgroup: comp.sys.atari.st
Date: 1990-05-12 16:37:06 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <886@ncs.dnd.ca>
Source record: 240995

Ref question on how a program knows its own name. Since there is no provision for a pointer to prog name in the basepage (surely an oversight) programs like cachexxx determine their names as follows:

a. Do an Fgetdta() to determine the dta location.

b. The prog name (just the name, not the path) is at offset 30.

Notes:

1. This is left over from the Fsfirst/Fsnext call that located the program so the name is in directory format - i.e. 8 + 3 + null byte.

2. Get it quick before the dta is used for other things.

Bob

As many have pointed out, the tutorials are available at the Lancaster archive in England. I've actually had these for almost a year now, but Lancs only have the first 13 parts.

If you could mail me parts 14 - 17 + appendices, Howard, I'll pass them on to Lancaster.

Thanks,

Dave.

4257. Phantom Typist(s) [very long!!]

Newsgroup: comp.sys.atari.st
Date: 1990-05-12 17:13:15 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1990May12.171315.12165@ccu.umanitoba.ca>
Source record: 240998

A Poor User's Guide to the Phantom Typist(s)

[This is very long -- about 13K -- so hit 'n' now if you're not interested. You were warned.]

I'm typing this in Word Perfect, with the phantom typist screwing around in my machine. I've a few details to report on the care and feeding of the critter.

(I'd better reboot first; typing with the phantom in tow is just too painful.)

There, that's better. To begin with, a point of clarification. There are TWO distinct phenomena which have been referred to as the "phantom typist".

The symptoms of the first are that you'll be typing away, and suddenly the last few characters you typed will start slowly repeating themselves over and over again on your screen. (I _think_ it's always been 3 chars in my case, but this may be accidental.) This bug is quite rare, and quite DEADLY. (I've seen it maybe 4 times in two years of heavy usage; in fact I'd forgotten all about it until it struck a couple of days ago -- @#$%^&*!) Once it hits, you're toast. Keyboard and mouse input have no effect whatever, so there's no opportunity to save your file; all you can do is sit and watch the same few chars get repeated until your machine crashes (20 seconds or so, in my experience). A warm boot makes it go away.

If I'm not mistaken, the term "phantom typist" was originally coined by someone at WPCorp. to refer to this behaviour. I believe they claimed that it was due to a bug somewhere or other in TOS, but that they couldn't get Atari Corp. to listen. Let's call it the "phantom repeater" to avoid confusion.

The second phenomenon that is sometimes referred to as the phantom typist is the system slowdown that's been much discussed of late on the net. (Call it the "phantom slowdown"; it may or may not be related to the phantom repeater.) Typical symptoms are that you'll be typing away and keyboard/mouse input suddenly slows to the speed of molasses. No chars actually appear other than those you type; it's just that your mouseclicks/keypresses take effect painfully slowly (ranging from numbers of seconds to minutes). Moving the mouse around makes the keypresses or button clicks take effect immediately, however. You can usually save

your document and exit normally to the desktop, but the phantom persists at the desktop level. A warm boot makes it go away.

It was the phantom slowdown that was afflicting my machine a few minutes ago. It struck not long after I booted WP, and before exorcising it I decided to do a bit of experimenting. Here's what happened.

I was typing in WP (my usual speed, not too fast but not too pokey -- maybe 40 words/min), and everything was fine. I paused to read what I had written, cursored up a few lines, then down a few lines (a curious habit that most computer authors seem to pick up sooner or later), and wham, the phantom had me. Whether it was there before I hit the up-arrow key, I don't know. I do know that it didn't show any symptoms before I hit the up-arrow key, because I watch the screen pretty carefully when I write.

Anyway, I hit F7 to save my work, exited to the desktop, and decided to experiment a bit before rebooting. Someone had recently reported that the slowdown appears to affect only GEM prgs, so the first thing I tried out was some non-GEM stuff. Sure enough, Moshe Braner's GNOME.TTP was a speedy as ever. DC SHOWIT also worked fine; I could cursor up and down through text files with no slowdown at all. (Thanks, Mike; great hack!) Then I tried DCOPY312.PRG; it's a non-GEM prg which optionally allows you to select files with the GEM file selector. Keypresses took effect immediately at the main menu, but as soon the file selector was invoked the phantom reappeared in all its sticky-molasses glory. Hmmm.

While I was playing around with the GEM selector in DCOPY I noticed something that I hadn't before: when the phantom is active, you can short-circuit the wait between keypresses and actions not only by moving the mouse, but also by hitting the Shft, Ctl, or Alt keys. I thought that warranted more investigation, so I exited DCOPY and ran WP again.

The first thing I noticed was also something that hadn't occurred to me before: When the phantom is active at the desktop, auto key repeat works as normal (as evidenced by the keyclicks -- the chars still don't appear in dialogues until you move the mouse); whereas the phantom disables auto repeat in WP. Auto repeat also works in GEM accessories invoked from the desktop, but not when they're invoked from within WP.

OK, now what about the Shft/Ctl/Alt thing? Sure enough, hitting an alphanumeric key and then pressing (L-or-R) Shft caused the key to take effect immediately in WP. There was some weirdness with the Ctl and Alt keys, though. (As it turns out, this wierdness appears to be due to the way WP maps the keyboard.) What seemed to happen is this:

If you want an alpha char in your document, just press alpha (doesn't matter whether you release it or not) and then press Shft; the char will appear on your screen as soon as the Shft key makes contact. If you want to input a Ctl/Alt-alpha combination, however, then you press alpha _followed_ _by_ Ctl/Alt. I.e., when the phantom is active in WP, alpha followed by Ctl/Alt does what Ctl/Alt-alpha does under normal circumstances.

This also works for function keys (and this time all of Shft/Ctl/Alt work the same). If you want shifted F1 (invokes the super/subscript menu), you press F1 by itself (again, doesn't matter if you release it or not), and then as soon as one of the Shft keys makes contact the super/subscript menu will appear. Similarly, F1 followed by Alt gives you the thesaurus, while F1 followed by Ctl invokes the shell (or rather, it would if WP-ST allowed access to a shell).

How do you invoke commands bound to _unshifted_ fn keys? (To get a normal alphanumeric you hit the alphanumeric followed by Shft, but doing this with fn keys gives you the _shifted_ fn key command.) Simple: You just hold down either Ctl or Alt (_not_ one of the Shft keys; that won't do anything at all), then hit the fn key you want, and then as soon as you _release_ Ctl/Alt the _unshifted_ fn key command will take effect. (That's simple, right? :-) A similar sequence works for shifted alpha-numerics: if you want a capital R, e.g., you hold down Shft, then hit the r key, and as soon as you _release_ Shft the R appears. (This appears to be about as close to normal behaviour as the phantom will tolerate in WP.)

As mentioned, some of this weirdness appears to be due to the way WP maps the keyboard. I had STalker (the terminal accessory) resident when the phantom struck, so I also played around with it for a bit. Pressing any alphanumeric followed by any of Shft, Ctl, or Alt caused the char to be immediately sent to the modem. STalker also uses Shft/Ctl/Alt combinations for various commands; to get them when the phantom is active you hold down Shft/Ctl/Alt, then hit the appropriate alpha or function key, and when you release Shft/Ctl/Alt the command takes effect (just like the shifted alphanumerics in WP).

Incidentally, hitting any of Shft/Ctl/Alt also makes chars appear immediately in desktop dialogues.

To sum up so far (and generalizing somewhat):

1. The phantom slowdown appears to afflict only GEM windows and dialogues (for more on this point, see below). When it's active, keypresses can be forced to take effect immediately by changing the state of one of the Shft/Ctl/Alt keys. Commands that would normally be invoked with a Shft/Ctl/Alt combination can be invoked when the phantom is present either by pressing the appropriate key first and then the Shft/Ctl/Alt key (WP), or by

holding down Shft/Ctl/Alt, pressing the appropriate key, and then releasing the Shft/Ctl/Alt key (STalker, upper case in WP).

A few other interesting facts I ran across in my experimentation:

2. When the phantom is active, multiple key presses are buffered, but only up to exactly 9 chars. (?!) I.e., if I hit <9 alphanumerics in a row, and then pressed Shft, all of the chars would appear immediately. But if I hit >9 alphanumerics before pressing Shft, exactly the first 9 appeared on the screen; the rest were lost forever. Caveat: The foregoing applies to both WP and to desktop dialogues. In STalker, however, while things worked similarly, exactly _8_ chars were buffered instead of 9 (??!!; beats hell out of me).

3. STalker supports fn key macros which can be up to 40 chars in length. Interestingly, the 8-char buffering limit doesn't apply to these macros. I.e., if I hit F1, and then hit Shft to temporarily short-circuit the phantom, all 40 of the chars in the F1 macro would immediately appear on the screen.

4. This one virtually guarantees that the phantom resides somewhere "higher up" in the OS, and that it's not (at least not exclusively) a problem with the IKBD. I use a corner clock called JCLOCK7 (by John Stanley, I think; thanks John, if you happen to read this). JCLOCK7 toggles its am/pm indicator from lower to upper case to indicate the status of caps lock. WP also has its own caps lock indicator in the status line at the bottom of the active window. When the phantom was active in WP and I hit the caps lock key, the JCLOCK7 indicator would invariably update at once. The WP indicator would update, however, only when I moved the mouse or pushed one of the Shft/Ctl/Alt keys. I.e., the caps lock key was being read and processed immediately, but somehow or other the phantom was blocking the transmission of its status to GEM. Moving the mouse or changing the state of Shft/Ctl/Alt temporarily unblocks the transmission, at least for the last nine keyboard events.

5. I'm not sure what relevance this one has (I've included it mainly because I'm going to send a copy of this note to the ST programmer at WPCorp., and it may give him a better idea of where the phantom actually resides). When you hit F10 in WP ("Save"), the program puts up the GEM file selector so that you can select the name of the file to save. When you hit 'OK' the GEM selector disappears, then WP checks the disk directory to see if the file you specified already exists, and if so, asks whether you want to replace it.
That's what should normally happen. When the phantom is active, however, and you invoke the Save command (which again, you can do without moving the mouse only by holding down Ctl/Alt before hitting F10), things work a bit differently. You press

Ctl-F10, and when the Ctl key is released the GEM selector pops up. Hit Return to use the default filename. Nothing happens (as expected; the phantom is blocking transmission of the Return, and we haven't done anything to unblock it yet). Now hit Shft. The GEM selector immediately disappears, but then....nothing. What _should_ happen at this point is that WP should check the directory to see if the specified file exists, and then put up the "Replace?" prompt. But it's not doing anything at all (I'm quite certain of this, because I removed the disk and then reinserted it before I hit Return, in order to insure that the directory wasn't cached). It's just sitting there.
If you now press Shft a second time, however, the directory gets read at once and then the "Replace?" prompt comes up. In other words, in this case we need to unblock the phantom TWICE, with two separate presses of Shft. The first one unblocks the Return, while the second one unblocks -- well, who knows what?

I guess that's all I have for now. I have no idea whether the phantom slowdown is due to an OS bug, or a bug in WP, or a bug in one of the multitude of TSR's and accessories I normally use. I know for a fact that some of the latter wouldn't pass muster as "well-behaved" (JCLOCK7, e.g., won't run under TOS 1.2 (I'm using 1.0), so it must be doing something naughty). On the other hand, the sheer number of people that have reported the problem in a variety of contexts makes it a priori unlikely that it's due to a bug in any single program, suggesting that it's due either to an OS bug or to a very common applications programming mistake.

But on yet another hand (doesn't everybody have three? :-), there's the fact that some users have recently reported the phantom appearing under Spectre; which doesn't jibe very well with the fact that its characteristic behaviour in native ST mode seems to be to block transmission of keyboard events to GEM. (Dave Small, are you out there?).

What really baffles me is that all of the stuff that I normally like to run can co-exist very happily together for days or weeks on end; and then all of a sudden, wham, the phantom appears out of nowhere. Anyway, as mentioned, I'm going to send a copy of this to WPCorp. in hopes that it will give them a few ideas on where to look. In the meantime, let's keep trying to narrow down the hypotheses.

[And to the good folks at Atari: You've been awfully silent about the phantom since kbad suggested the "chicken blood on the keyboard" fix. Any and all suggestions, hints, advice, whatever would be most appreciated. Have any of you experienced the phantom slowdown yet? What do you think I should try the next time it strikes?
[Maybe you could suggest to the boys "upstairs" that they

offer a reward to the first person that isolates the problem and figures out a fix -- a couple of free TTs, say, when they become available? Seems to me it would be well worth it. Whether the phantom is an Atari bug or someone else's, the person who finally tracks it down is someone you definitely want developing on your new machines.]

I goofed in my previous post on how a program can determine its name.
Missed it by one byte!

The name you want is still at offset 30 from the DTA but its format
is:
name 8 bytes padded with spaces
ext 3 bytes padded with spaces
attr 1 byte (attributes)
null 1 byte

Bob

Cross-posted to: comp.lang.modula2,comp.sys.atari.st

```
MOGLI - MOdula-2 GEM Library for the ATARI ST Computer Series.

MOGLI IS available now for: FTL (HiSoft) Modula-2
TDI Modula-2 (Shareware from Uwe Brahm)
SPC Modula-2
Momos Modula-2

MOGLI WILL BE available for: JPI Modula et al. on the PC. soon.

MOGLI is fighting against the growing Modula-2 binding jungle on the ATARI ST.

MOGLI gives access to all availiable functions on the ATARI ST
To obtain a copy of MOGLI send 20 DM (or 10 $) to:

Uwe Brahm
Carlo-Schmid-Strasse 15
D-6750 Kaiserslautern
West Germany

After receiving your money, you will get the original red 3 1/2 disk,
containig AES.DEF, VDI.DEF and OS.DEF and all the files your compiler needs.

Let's kill a couple birds with one stone here...

Unix Windows is a terminal program that can multiplex many terminal sessions over a single serial line, when communicating with a host running a uw server. Each session has a graphic window to itself. It's pretty decent, although it only supports adm-31 emulation at present.

The protocol, server, and user program were originally designed for the Mac. The Mac uw client also has a tektronix emulator, and a few other nice features.

Everything relevant to the program can be found on terminator, in the directory atari/telecomm. The files uwbin.arc and uwsrc.arc contain full Atari binaries and sources. The file uw.arc contains only the program with no support files. I believe this is also an outdated version of the program.

The file uw.tar.Z contains the distribution as gotten from the author. This compressed tar file contains the full source for the Unix server, the uw programming library, and binaries for the Mac. I haven't looked for a newer release in several months, this file is from November '89.

If anyone is interested in hacking on uw, I suggest you get the tar file and read through the protocol description. There's a lot allowed for in the protocol that the Atari client doesn't address. Could add something to the emulation... A really nice add would be to make it work with Micro-RTX, so you could not only open terminal windows, but TOS windows as well, and run them concurrently.

It's got a lot of potential, but like so many other things about the ST, it's going untapped...

4262. copyfix.prg

Newsgroup: comp.sys.atari.st
Date: 1990-05-12 20:58:51 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3271@rodan.acs.syr.edu>
Source record: 240902

Sorry I don't know how to include the previous messages in my own, but there were (at least) two messages stating that copyfix.prg, which comes with icd hard drive set ups, causes problems with other programs (one was Neodesk). Well, I'm going to add another: DCDESKTOP. When I finally got around to including copyfix.prg in my autofolder, it let dcdesktop load, but it messed up the desktop that had various icons on it, AND it did not show hard disk icons with my three partitions. In fact, it only showed one partition, and showed that partition using a "folder" icon.
Just out of curiosity, is copyfix.prg something one really needs? Based on the description of what it does, I can't tell what practical use it has. Maybe it is only something that is valuable to programmers? (which I'm not)

>
> Does anyone know the publisher? This is so that I can order more
> copies of this book direct from the States as no UK Book shop has been
> able to get hold of it.

The publisher is Bantam Books, 666 Fifth Avenue, New York NY 10103.
The ISBN number is 0-553-34397-1. The first, and probably only, printing
was in September 1987. I've heard that the book is out of print, but I
have not contacted the publisher.

It's a very good intro to GEM programming and includes quite a bit of
Atari-specific information. It's not the most in-depth book you might wish
for, and some of the information is just plain wrong, but I have not found
anything better.

It has C header files listed in the back that let me figure out how to
write a library of AES bindings for the Sozobon compiler before GEMFAST
became available. Line A, on the other hand, merits only a paragraph or two.

Would the author of Hagterm please e-mail me, if he reads this, let me know if the new, commercial, Hagterm program will have a disconnect line feature, and if it will allow me to automatically log on to various BBS's and record newsgroups to disk while I sleep ie, it needs to have a clock reading function to call during the night, various BBS's in a session (with the computer on and the program loaded, of course). If so, I want it.
Thank you!
Steve

4268. STs and the NEC/MultiSync GS2A monitor

Newsgroup: comp.sys.atari.st
Date: 1990-05-13 06:37:28 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900513.00372718.004135@SFA.CP6>
Source record: 240912

A couple of months ago, I mentioned on the net that my monochrome
monochrome died and no parts could be found to repair it. I reported that I
would try various multisync monitors and report back my findings, in case
anyone is eyeing the 'superior' multisyncs.
Well, ambitions gave way to time constraints but here is a very
limited summary. Two monitors that I am using are the Mitsubishi
Diamond Scan (14" one) and the NEC/MultiSync GS2A monitor. I'll be
concentrating on the latter but want to mention the Diamond Scan first.
If you are used to using the crisp and sharp Atari monochrome monitor,
then you will be VERY UNHAPPY with the Diamond Scan. The characters, in
monochrome mode are just too fuzzy. One can adjust the contrast and
brightness, and can make internal adjustments, and the fuzziness just won't
go away. For backup use, or for occasional monochrome use, the Diamond
Scan would be more than adequate, but for regular use, I think the user
will be disappointed when going to monochrome mode. Color, on the other
hand, is beautiful. Rich, sharp, neon-like. Controls in the back are a
bad no no, though.
The NEC/MultiSync GS2A monitor is the only way to go for monochrome
use. It is crisper and much sharper than the Atari monochrome monitor
and certainly more controllable. The screen's size can be easily
adjusted from the front. The cost is within $50.00 of the Atari monitor.
Ok, what about hooking these things up? Well, the ST's voltages
and what not appear to be perfect, as the various tech articles on the
nets indicate. Two things can be done: Buy the various connector
boxes, such as Talon's OmniSwitch (boo, hiss -- I'll explain later), or
build your own cable using the ST's pin-out and the monitor's pin-out
diagrams. I was mildly surprised that with the use of test leads and
only three wires, connecting horizontal sync, vertical sync, and video,
to the corresponding pins on the monitor cable for the ST, that I was
able to get a perfect picture for monochrome. It was that easy.
The Talon box is the pits, in my opinion. It has two multisync
connectors: 9 pin and 15 pin. The 15 pin connector smeared the
charactors when using it as the 'interface' between the ST and the
NEC. It wasn't until I discovered that the DB casing was NOT grounded
that I was able to get a clean picture. I grounded the casing and
the smearing disappeared. I then was rewarded with sharp charcters but
slightly noticeable shadowing. My home-brew cable with the test leads
produced a sharper image.
I then removed the plug on the NEC and replaced it with a nine pin
connector, using the pin out diagrams for both computer and monitor.
Perfect image. Hint: never use the 15 pin port on the OmniSwitch.
Another problem...
The NEC/MultiSync GS2A monitor has 'unlimited gray scaling' but
there is nothing that I can do to get the monitor to work in color

mode. I get a very enlarged picture. The theory is that colors are converted into gray scales. Can anyone in the know comment on this and if it can be done with the Talon box?
Summary: The NEC/MultiSync GS2A monitor is superior to the Atari monochrome monitor at a price of about $225 locally.

The Mitsubishi Diamond scan is barely acceptable as a monochrome monitor but excels as a color monitor.

The Talon OmniSwitch is the pits in that modifications have to be made (connecting the DB 15 pin connector out case to ground). Also, it produces light shadows and ghosts. The 9 pin connector seems to be less prone to the shadowing and ghosting.

The NEC/MultiSync GS2A monitor is capable of gray scaling and supposedly can support color mode. I have not been successful in getting this to work.

If anyone can comment or confirm my Talon report and to offer a solution for the gray scaling problem, I'd be appreciative and will sum up on the net.
Closing remark: The NEC/MultiSync GS2A monitor is incredible and affordable. HIGHLY RECOMMENDED.

A few questions about the STe. I would appreciate any help you guyz can give me.

1) Just how "intelligent" is the STe keyboard? Is it so hard to replace with something better, or would it be possible to plug something into the new analog input sockets?

2) If I wanted to use a comms link for my Psion Organiser ("A WHAT" I hear you cry) to an STe, can I just use any RS232 comms software? If not, is there anything around to do it, and could you give me the name of a good package either way? (Pref. PD - I'm only a poor student after all!)

3) Anyone know how to do overdubbing on the Mastersound sequencer from Kempston? I've done everything the manual says but it keeps recording straight over the original track. (Actually that's a lie, it did work once, but I don't have a bloody clue what I did differently!)

4) I want to use the graphics facility on First Word+. Which is the best IMG package to use. (PD preferred again)

That's it, answers either via the net or on the back of a postcard to:

cstxqdl@uk.ac.warwick.cu

4277. tsrcom programs

Greetings all.

[note - for those of you who don't know, TSR stands for Terminate and
Stay Resident - aka Memory Resident programs]

On the PC, I use a set of utilities under the name of TSRCOM - there are
three of them which are really useful

mapmem - describes what is in memory
mark - sets a mark in memory
release - releases all memory upto and including the mark

This is useful if for example, I want to have a TSR program in memory
sometimes but I want to get rid of it without rebooting. I do a mark
first, then run the tsr program, and then when I want to get rid of it,
I do a release.

Is there something like this available for the ST?

When TOS 1.0 or TOS 1.2 copy files the target files are time-stamped
with the current date and time instead of the original time-stamp.
Copyfix tries to fix this one, but it assumes that filenames can
only start at even addresses. Therefore, it bombs with some
programs. The GEMDOS docs don't require the name to start at an
even address, so I guess it's a copyfix bug.

Tnx Marten!

I have sensed lots of encouragements from netters in the above matter so
I dare post another msg concerning the discussion here. Chris Evelo,
who posted POOLFIX4 for me, sent me excerpts from the start of the
discussion when I wasn't on the net. This message shall serve as a means
to clear up some of the confusion.

Julian Reschke wrote somewhere:
>[quoting my readme file from POOLFIX4]...
>...
>>As always, users are forced to do the patching themselves. In this...
>>(this is still a quote from my readme, which Julian commented like
>> this:)
> Patch your OWN brain-damaged software! :-)

Dear Julian, I don't like that. You're simply missing the point of all
this. No matter whether my driver uses the Trap #1 vector or not, there
are other programs that do, and they will pose similar difficulties to
users in conjunction with POOLFIX3 as my driver does. Using the TRAP #1
vector is from all my knowledge PERFECTLY LEGAL (as long as you use
XBRA), and every program that breaks a program using the TRAP #1 vector
legally to my eyes is at least not quite correct. That POOLFIX3 wouldn't
run with my driver, was the incentive for doing the patch, but if was
NOT the real _reason_. Got that now? Fine.

Apart from that, I'd like to ask to think about what you're writing
before you post it. I tested your software for a German computer
magazine recently, and though I found some bugs and features that

you could as well call 'not quite correct', I didn't call your software "brain-damaged" in the public. It wouldn't have deserved it, and I think my driver hasn't, either. Remember that it is probably the most wide-spread third-party all-brand hard disk driver in Germany and in Europe, and users are quite content with it. They also really like the DESKTOP.INF patch included in the last version. Don't you think you're a little arrogant if you try to avoid seeing what users want out there in userland? Come on, Julian, being a guru is fine, but is worth nothing if you lose contact with your users.

One last point: I wonder why you, Julian, reacted so strongly on POOLFIX4. You're not ATARI, and you don't have to fight for them! As far as I can judge from the reactions I read, Mr Pratt seems less upset about the whole matter than you.

What would I say if someone came up with a patched CBHD version called CBHD 3.6? Well, I have apologized for the naming already, but remember there's a slight difference. CBHD is a commercial software whereas POOLFIX seems to be something like PD or even freeware (what else might a TOS fix be? ATARI wants everyone to have it!).

To help calm you down a bit, Julian, I can tell you that the whole DESKTOP.INF thingy will be optional in later versions of my driver. I will also look at your proposal of having a DA save the DESKTOP.INF, tnx.

Keep hacking,

Claus Brod

Wow, you read it here first on usenet: removing the shielding (that is
wrapped around the OUTSIDE of all the circuit boards) that was designed to
reduce radio and television reception interference, will make electrical
signals take several milliseconds longer to propagate through wires. In
fact, the wires become storage devices capable of storing several clock
pulses along their lengths. RAM prices should drop dramatically now
that the secret is out, otherwise everybody will replace their RAMs
with loops of wire. Anybody want to continue this thread on alt.urbane.
legends?

What sort of a school is this "wesleyan" anyways? Judging by the
.signature it must be either philosophy or theatre. It's certainly
"creative".

From my own experience with memory upgrades, I would say that the problem
is that there are two different physical banks of RAM being accessed as
the same logical bank. I upgraded my 520 to a 1040 a long time ago.
When the price of 1M chips dropped low enough last year, I popped in

a set and had results much the same as those described above. The problems went away when I removed the 256K DRAMs that were part of the initial upgrade.

My upper RF shield was recyled long ago (it's probably part of a Buick now) because the RAM + shield wouldn't let me put the keyboard back in.

Cheers
John

I thought cachexxx.prg and similar (Atari) programs used Fsfirst/Fsnext
to look for programs named cache*.prg (or whatever). I'd be very surprised
indeed if Atari has guaranteed that a program's initial dta will contain
its name. If they haven't, then you can bet that programs that rely on
this undocumented feature will break under future versions of TOS (or
under MicroRTX or similar multi-tasking operating systems). In other words,
don't do it.

If a program really needs to know its own name, it should be started from
a shell that supports the (Atari standard) ARGV= mechanism for passing
arguments; argv[0] will be the program's name.

Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st

[I did not receive a call for discussion for this group.-eliot]

*** PLEASE READ THIS ENTIRE MESSAGE BEFORE REPLYING ***

This is the first call for votes for creation of a new group

comp.sys.atari.st.tech

The voting period will last until 11:59 PM on June 4, 1990.

*** DON'T VOTE UNTIL YOU READ THE WHOLE MESSAGE! ***

The charter of the group, if created, will be as follows:

Charter for comp.sys.atari.st.tech
---

comp.sys.atari.st.tech is devoted to technical discussion
regarding Atari ST software and hardware. Examples of topics to
be discussed in this newsgroup include:

"What are the pinouts for the ___ port on the ST?"

"Has anyone managed to hook up a ___ successfully?"
(Assuming this is a nontrivial task)

"Which system vector controls ____?"

"What is the official, Atari-sanctioned method of doing ___?"

"What are the specs for ___ file format?"

"How does ___ manage to get 20 million colors on the screen?"

"What is the best way to do fine scrolling?"

Examples of topics NOT to be discussed in this newsgroup include:

"How do you get past the dragon in ___ game?"

"For sale: ___"

"New product announcement: ___"

"My ST is better than your ___ because"

"My ___ is better than your ST because..."

"Atari's financial situation is ___"

---

comp.sys.atari.st.tech, if created, will be unmoderated.

HOW TO VOTE

To cast a vote, send a mail message to dmb@wam.umd.edu with either of
the following subject lines:

Subject: Vote YES for comp.sys.atari.st.tech
Subject: Vote NO for comp.sys.atari.st.tech

THE BODY OF THE MESSAGE WILL BE IGNORED. Nothing placed in the body will
be used in counting votes.

No vote with an incorrect subject line will be counted!

ONLY votes MAILED to dmb@wam.umd.edu will count. Votes posted to the net
for any reason (including inability to get mail to dmb@wam.umd.edu) and
proxy votes (such as having a mailing list maintainer claim a vote for
each member of the list) will not be counted.

Voting deadline: 11:59PM June 4, 1990

4285. floppy b: continues to spin on hard disk autoboot

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 02:06:10 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3275@rodan.acs.syr.edu>
Source record: 240927

Now I know why I took so long to get a hard drive! There is a lot to keep track of! Here's the latest: I've got a 1meg 520 with tos 1.0, an ICD hard drive kit, two external floppies. When autobooting from the hard disk, the busy light in floppy a: comes on, then goes off, then the busy light in floppy b: goes on and stays on...floppy a: continues to spin, but it seems that floppy b: is not spinning. When I open floppy a:, the light on b: goes off and everything is back to normal. I seem to remember there was a similar problem for the Megas, so I located a little program that, when added to an auto folder, would access drive a: so that it would then stop spinning. I tried out this fix, and it worked. As I was trying to see if there was some other program in the auto folder that was causing the problem, I found that if I booted from the hard drive AND there was an actual floppy disk in drive b: upon bootup, there was no problem...somehow, once drive b: saw that there was a disk in it, the light would go off and drive a: would stop spinning. So, I guess I'm just wondering if there is something in my setup that is causing this? or if this is normal, and I should just keep a floppy disk in drive b: at all times?
Thanks in advance for any suggestions. As usual, you can email me directly, or post to the net.

4286. Re: Determining Own Name - Major BooBoo

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 03:11:06 UTC
From: balkwill@ncs.dnd.ca
Message-ID: <888@ncs.dnd.ca>
Source record: 240928

Eric Smith is absolutely right in pointing out the error of my previous posting about how a program can determine its own name. I was looking at a disassembly of cachennn when I wrote it but apparently not with both eyes. In short, I missed the Fsfirst() call.

A general solution to the problem that doesn't break any rules or make assumptions about future TOS's is unknown to me. True, that if one has a shell that uses ARGV and if one's compiler inserts ARGV-compatible startup code, all is fine. Not all shells and compilers cooperate.

Dlibs uses a method (with uncooperative shells) based on accessing the stack of the parent process (assuming there is one) to see what name it supplied to the Pexec(). It works but it looks kind of fragile unless Atari has sworn not to alter the key components.

There does appear to be a reserved slot in the basepage at offset 40. Perhaps this was originally intended to point to prog name. It would have been nice.

P.S. I tested my 'procedure' and got a nice virgin-looking dta - all zeros.

4287. Pexec Cookbook: Here it is

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 06:53:57 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <2156@laura.UUCP>
Source record: 240929

Many people asked for the Pexec Cookbook or wondered what it was. What I have and post hereby is a "preliminary version of the long-awaited Pexec cookbook". It was posted already some time ago ("those good old days") by Allan Pratt (Atari) in this newsgroup. I do not know if a newer version exists. - Appended to the Pexec Cookbook you will find some more comp.sys.atari.st articles on the subject of program calling. Hopefully you will find some useful information there!

========== snip, snip
==========

Allan Pratt (Atari) on the subject of Pexec:-

This is in response to a request from Christian Kaernbach which I got from BITNET: I can't reply directly to BITNET, but I'm sure other people will find this interesting, too: it's a preliminary version of the long-awaited Pexec cookbook!

In broad terms, the things you have to know about Pexec are that it starts up a process, lets it execute, then returns to the caller when that process terminates. The "caller" -- the process which used Pexec in the first place -- has some responsibilities: it has to make memory available to the OS for allocation to the child, and it has to build up the argument string for the child.

All GEMDOS programs are started with the largest block of OS memory allocated to them. Except in very rare circumstances, this block is the one stretching from the end of the accessories and resident utilities to the beginning of screen memory. The point is that your program has probably been allocated ALL of free memory. In order to make memory available for a child process, you have to SHRINK the block you own, returning the top part of it to GEMDOS. The time to do this is when you start up.

If you use Alcyon C (from the developer's kit), you know that you always link with a file called GEMSTART. If you've been paying attention, you should have gotten the *new* GEMSTART from Compuserve (or from somebody else who got it): I wrote that GEMSTART. In GEMSTART.S, there is a lot of discussion about memory models, and then a variable you set telling how much memory you want to keep or give back to the OS. Make your choice (when in doubt, use STACK=1), assemble

GEMSTART.S, call the result GEMSEXEC.O (or something), and link the programs which Pexec with that file rather than the normal GEMSTART.

Now here's a discussion of what GEMSTART has to do with respect to keeping or returning memory:

Your program is invoked with the address of its own basepage as the argument to a function (that is, at 4(sp).l). In this basepage is the structure you can find in your documentation. The interesting fields are HITPA (the address of first byte NOT in your TPA), BSSBASE (the first address of your bss) and BSSLEN (the length of your BSS).

Your stack pointer starts at HITPA-8 (because 8 is the length of the basepage argument and the dummy return PC on the stack). The space from BSSBASE+BSSLEN to your SP is the "stack+heap" space. Library malloc() calls use this space, moving a pointer called the "break" (in the variable __break, or the C variable _break if you use Alcyon C) up as it uses memory. Your stack pointer moves down from the top as it uses memory, and if the sp and _break ever meet, you're out of memory. In fact, if they ever come close (within a "chicken factor" of about 512 bytes or 1K), malloc() will fail because it doesn't want your stack to overwrite good data.

When a process starts, it gets *all* of memory allocated to it: from the end of any accessories or resident utilities up to the default screen memory. If you want to use Pexec, you have to give some memory back to the OS. You do this with the Mshrink call. Its arguments are the address of the memory block to shrink (your basepage address) and the new size to shrink it to. You should be sure to leave enough room above your BSS for a reasonable stack (at least 2K) plus any malloc() calls you expect to make. Let's say you're writing "make" and you want to leave about 32K for malloc() (for your dependency structures). Also, since make is recursive, you should leave lots of space for the stack - maybe another 16K. The new top of memory that your program needs is:

newtop = your bss base address + your bss size + 16K stack + 32K heap

Since your stack pointer is at the top of your CURRENT TPA, and you're about to shrink that, you'd better move your stack:

```
move.l newtop,sp
```

Now you want to compute your new TPA size and call Mshrink:

```
move.l newtop,d0
sub.l basepage,d0 ; newtop-basepage is desired TPA size
move.l d0,-(sp) ; set up Mshrink(basepage,d0)
move.l basepage,-(sp)
move.w #$4a ; fn code for Mshrink
trap #1
add.l #10,sp ; clean up args
```

Now that you've shrunk your TPA, the OS can allocate this new memory to your child. It can also use this memory for Malloc(), which is used occasionally by GEM VDI for blt buffers, etc. Note that you only have to do this once, when you start up: after that, you can do as much Pexec'ing as you want.

When you want to exec a child, you build its complete filespec into one string, and its arguments into another. The argument string is a little strange: the first character of the argument string is the length of the rest of the string!

Here is a simple system call: pass it the name of the file to execute and the argument string to use.

```
long system(cmd,args)
char *cmd, *args;
{
char buf[128];

if (strlen(args) > 126) {
printf("argument string too long\n");
return -1;
}
strcpy(buf+1,args); /* copy args to buffer+1 */
buf[0] = strlen(args); /* set buffer[0] to len */
return Pexec(0,cmd,buf,0L);
}
```

The first zero in the Pexec call is the Pexec function code: load and go. The cmd argument is the full filespec, with the path, file name, and file type. The third argument is the command-line argument string, and the fourth argument is the environment pointer. A null environment pointer means "let the child inherit A COPY OF my environment."

This call will load the program, pass the arguments and environment to it, and execute it. When the program terminates, the call returns the exit code from the program. If the Pexec fails (not enough memory, file not found, etc.) a negative code is returned, and you should deal with it accordingly. Note that error returns from Pexec are always negative LONGS, while return codes from the child will have zeros in the upper 16 bits.

EXIT CODES:

GEMDOS, like MS-DOS before it, allows programs to return a 16-bit exit code to their parents when they terminate. This is done with the Pterm(errcode) call. The value in errcode is passed to the parent as the return value of the Pexec system call. The C library function exit(errcode) usually uses this call.

Unfortunately, the people who wrote the startup file for the Alcyon C compiler didn't use this. The compiler calls exit() with an error code, and exit() calls _exit(), but _exit always uses Pterm0(), which returns zero as the exit code. I fixed this by rewriting GEMSTART.S, the file you link with first when using Alcyon.

Even though new programs return the right exit code, the compiler
itself still doesn't. Well, I have patched the binaries of all the
passes of the compiler so they DO. It isn't hard, and I will post
instructions at a later date for doing it. IF YOU DO THIS, PLEASE
DON'T BOTHER OUR CUSTOMER SUPPORT PEOPLE IF IT DOESN'T WORK. THEY
DON'T KNOW ANYTHING ABOUT IT.

I hope that this little cookbook makes Pexec less mysterious. I haven't
covered such topics as the critical-error and terminate vectors, even though
they are intimately connected with the idea of exec'ing children. A more
complete cookbook should be forthcoming.

If there are any errors or gross omissions in the above text, please
let me know BY MAIL so I can correct them coherently. Landon isn't
here to check my semantics, so I may have missed something. [Landon
is on vacation in France until early September.]

****

C. Kaernbach's question was why his accessory, which basically did
a Pexec from a file selector, didn't always work. The answer is that
it works when used within a program which has returned enough memory to
the OS for the child. Why might it bomb? Because if a program has
returned a *little* memory to the OS (only about 2K), a bug in Pexec
shows up that breaks the memory manager. Accessories are strange beasts
anyway, so for the most part combining two strange beasts (Accessories
and Pexec) is bad news.

\-----------------------------------------------/ (APRATT on GEnie)
```

in article <767@saturn.ucsc.edu>, koreth@ssyx.ucsc.edu (Steven Grimm) says:

```
> #include <osbind.h>
>
> main()
> {
> long basepage;
>
> basepage = Pexec(3, "test.tos", "", 0L);
> printf("basepage = %08lx\n", basepage);
> Pexec(4, 0L, 0L, basepage);
> printf("done\n");
> }
```

The correct call for Pexec type 4 is "Pexec(4,0L,basepage,0L);"

The combination of load/nogo plus just-go does not work reliably.
There are bugs in Pexec relating to memory ownership which cause trouble.

You should be able to determine something about where the bombs are,
though: is the PC in ROM, or less than "basepage" (i.e. in the parent),
or greater than basepage (i.e. in the child)?

I have a trick which *does* work for fooling with a child before it has
started executing, but it is ugly. I use it in my debugger. What are
you trying to do? Maybe the same trick would work for you. Mail me more
explanation.

```

in article <1322@dasys1.UUCP>, stevef@dasys1.UUCP (Steve A. Feinstein) says:
> Does anyone know
> if there is anyway to, say load a program into the top of the TPA
> and execute it up there. So that when it exits, there won't be any holes?

There is one way to do this with Pexec, but it requires knowing how much
memory the program will need (lots of heuristics here).

```
long topPexec(cmd,args,env,size)
char *cmd, *args, *env;
unsigned long size;
{
unsigned long blocksize;
char *addr;
long ret;

blocksize = Malloc(-1L); /* find out size of largest block */
if (block < size) {
return ENSMEM; /* largest block not big enough! */
}
addr = Malloc(blocksize); /* allocate that block */
Mshrink(addr,blocksize-size); /* shrink it by size TSR needs */
ret = Pexec(0,cmd,args,env); /* exec the TSR */
Mfree(addr); /* free the padding */
return ret; /* return the exit code */
}
```

This procedure takes a "size" argument which is the amount of memory
the program in question will need for its text, data, bss, basepage,
environment, and stack/heap. This is not a computable number: you
have to figure it out empirically. text+data+bss+env+10K or so should
work, but you will always leave a small hole at the top of memory,
because TSR's always Mshrink a little bit.

```

```

Attention Mark Williams, Beckmeyer, and Gert Poltiek, and anybody
else interested:

There is a trick that some shells and compiler libraries use that lets
you pass argument strings to programs which are longer than the 127

bytes which fit in the command line area of the basepage. Their trick is to put the word ARGV= in the environment, and follow it with a null-separated list of argument strings. The list is terminated with another null.

This scheme works pretty well, but has two drawbacks, one major and one minor.

The minor drawback is that it defies the definition of what is in the environment: the environment should consist of strings of the form NAME=value<NUL> terminated by a final <NUL>. This is minor because shells using this convention usually put the ARGV information at the end of the environment anyway.

The major drawback is that you can't tell if the ARGV string in your environment is really meant for you. Imagine you have the Mark Williams shell (msh), an editor compiled with Alcyon, and another utility like "echo" compiled with MWC. Imagine further that the editor has a "shell-escape" command that lets you execute another program from within the editor.

Do this:

From msh (the MWC shell): start up the editor with the command line arguments "this is a test."

Tell the editor to execute the command "echo hello world."

The "echo" command will echo "this is a test," not "hello world."

What happened is that msh put "this is a test" in the environment for the editor (as well as in the command tail in the basepage). The editor, not knowing any better, didn't put "hello world" in the environment before executing "echo." When "echo" started, it found "ARGV=this is a test" in its environment and echoed that.

What is needed is a way for a program to tell if the "ARGV=" string in its environment is really intended for it, or is just left over from an earlier program. There is a way to do this that doesn't affect old programs compiled without this fix.

The new convention could be to place another string in the environment with your own basepage address, before Pexec'ing your child. The child could start up, and check to see if its parent's basepage address (in its basepage) matches the address in the environment. If it does match, the child will know that the ARGV= string is for it. If it doesn't match, the child will know it was started from a non-MWC program like the editor above, and will look in its basepage for the command line.

Note that if the parent's basepage isn't in the environment at all, but the ARGV= string is, the child must assume that the ARGV string is intended for it, just as it does now. Therefore, old-style programs could still Pexec new-style children, and vice-versa.

This would all require a change in the startup code that calls main(),
and the exec() code which Pexec's the child.

How about it, guys? If we could all agree on the name and format of this
new environment variable, we could get rid of a serious flaw in Mark
Williams' otherwise clever scheme. Other shells could adopt this, too,
and ultimately everybody would be able to kiss the 127-character
command-line limit goodbye.

For now, I propose that the environment variable in question be called
PBP, and that its value be the decimal string of digits making up the
parent's basepage. The reason for this is that almost all libraries
have an atol() function, where not all have an atolx() function.

A shell using this trick, with a basepage at 366494 (decimal), could
Pexec a child called "test.prg" with these strings in the environment:

```
...
PBP=366494<NUL>
ARGV=test.prg<NUL>first<NUL>second<NUL>third<NUL><NUL>
```

In the startup code of the child, you would do something like this:

```
If there's a PBP= in the environment
If atol(PBP) == my parent's basepage
get args from environment
else
get args from command line
endif
else
if there's an ARGV= in the environment
get args from environment
else
get args from command line
endif
endif
```

Does this sound reasonable? I would like to see this kind of thing
become a standard, but until a safeguard like this is in place, I can't
condone using ARGV= in the environment for finding your arguments. It's
too chancy just to assume that you were started by a program savvy to
this scheme.

```

I'm not sure that MSH does* detect being called from the desktop. What
difference would it make (or does it in MSH). The basepage, however,
DOES* contain a "backward pointer" to the parent processes basepage.
Here is a struct to clarify...

```
typedef struct
{
char *p_lowtpa; /* pointer to self (bottom of TPA) */
char *p_hitpa; /* pointer to top of TPA + 1 */
char *p_tbase; /* base of text segment */
long p_tlen; /* length of text segment */
char *p_dbase; /* base of data segment */
long p_dlen; /* length of data segment */
char *p_bbase; /* base of BSS segment */
long p_blen; /* length of BSS segment */
char *p_dta; /* pointer to current DTA */
char *p_parent; /* pointer to parent's basepage */
char *p_reserved; /* reserved for future use */
char *p_env; /* pointer to environment string */
long p_undefined[20]; /* scratch area... don't touch */
char p_cmdlin[128]; /* command line image */
}
BASEPAGE;
```

> Question #2 : I read again the dev kit doc on shell_p, the posting
> by A.Pratt about it, and I still wonder : what is it ?
> I would infer it is a pointer to a string telling the file name of a shell...
> I am right ?
> What would be the use otherwise ?

The shell_p variable, if it is valid, should point to a routine which
will take a string argument and process it like the Un*x system() call.
Here is an example implementation of system() which tries to use the
shell_p variable, if possible.

```
/*------------------------------------------------------------------------*/
#include <osbind.h>
#include <stdio.h>
#include <string.h>
#include <basepage.h>

static parse_args(cmdln, argv)
char *cmdln;
register char *argv[];
{
register char *p;
static char delim[] = " \t\r\n";

if(p = strtok(cmdln, delim))
{
do
{
*argv++ = p;
} while(p = strtok(NULL, delim));
}
}

int system(command)
register char *command;
/*
* Attempts to pass <command> to the shell program pointed to by
* the system variable "_shell_p". If a valid shell can't be found
* there, the "SHELL" environment variable is searched for. If it
* exists and is not empty, it will be the name of the shell program
* to execute the given command. If "SHELL" is not valid, the
* "PATH" variable is used as a list of directories to search for
* the program name which is the first token of the command. The
* extensions tried (if none is specified) are ".TTP", ".TOS",
* ".PRG" and ".APP".
*/
{
register char *p;
register int (*shell)();
char rv[2];
char cmdln[1024];
char *args[64];
char *getenv();

if(!command)
return(ERROR);

/* get _shell_p value */
p = Super(0L);
shell = *((long *) 0x4F6L);
Super(p);

/* validate _shell_p */
if((shell) && /* Shell available. */
```

```
(((long) shell) < ((long) _base)) && /* Reasonable shell pointer. */
(strncmp(shell, "PATH", 4))) /* Not corrupted */
{
/* execute the command */
return((*shell)(command));
}

/* copy the command line for parsing */
strcpy(cmdln, command);

/* SHELL= variable? */
if((p = getenv("SHELL")) && (*p))
{
args[0] = p;
parse_args(cmdln, args+1);
forkvpe(p, args, NULL);
wait(&rv);
return((rv[1] == 0) ? rv[0] : rv[1]);
}

/* attempt to find first token as a program on the path */
parse_args(cmdln, args);
if(p = pfindfile(args[0], ".ttp\0.tos\0.prg\0.app"))
{
forkvpe(p, args, NULL);
wait(&rv);
return((rv[1] == 0) ? rv[0] : rv[1]);
}
return(ERROR);
}
/*------------------------------------------------------------------------*/
```

I hope this answers your question. It's so easy for a shell to install itself on the shell_p vector and it's so convenient if other program which support shell escapes use a system() call like the one above. In case there is any question about installing and removing the shell_p vector, the following routines will handle it nicely.

```
/*------------------------------------------------------------------------*/
long (*sh_save)(); /* previous value of _shell_p variable */

sh_install(new_shell)
int (*new_shell)();
/*
* install _shell_p vector
*/
{
register long *ssp;
register (**shell_p)() = 0x4F6L;

ssp = Super(0L);
sh_save = *shell_p;
```

```
*shell_p = new_shell;
Super(ssp);
}

sh_restore()
/*
* restore old _shell_p vector
*/
{
register long *ssp;
register (**shell_p)() = 0x4F6L;

ssp = Super(0L);
*shell_p = sh_save;
Super(ssp);
}
/*------------------------------------------------------------------------*/
```

PS. For those waiting for dLibs v1.1 and/or MicroEMACS 2.19, I have
sent out disks for all the requests I had outstanding, you should either
already have them, or should receive them soon. Sorry for the delays.
I hope you're happy with the results. I'd like to hear from some of you
after you've used dLibs a bit. I'd be happy to receive bug reports,
suggested enhancements or just experiences so that I know they're being
put to good use.

The best program to accomplish this is called barrel written by
Moshe Braner. It has several functions to allow capturing text or
screen dumps to a file. It is TSR (terminate & stay resident) which
may or may not be what you originaly wanted, but it is good and it
works....

In article <15@obie.UUCP> wes@obie.UUCP (Barnacle Wes) writes:

> Hope this helps whoever it was!

Not likely... The example you gave will bomb miserably... The
parameters you gave for Pexec are in the wrong order and ignore an
important pecularity in the Pexec call (the command tail is a Pascal
style string, not a C style string).

The correct order for Pexec parameters is:
Pexec mode: zero is fine
Program name: standard C string format
Command tail: a pointer to a Pascal style string (a string
with the character count in the first byte!)
Environment: A pointer to an environment block or NULL if
you want to use the default environment.

Thus, a corrected version would read:

```
static unsigned char tailbuf[255];
....
tailbuf[0] = strlen(tail);
strcpy(tailbuf+1,tail);
Pexec(0, "A:\\folder1\\folder2\\program.ttp", tailbuf, (char*)NULL);
```

Never used gemdos call 0x4b (Exec) with a mode of 4?
You can have preloaded programs on the Atari ST as well, and it works quite
nicely. I used it in a find command and in a shell I programmed for the Atari
(yes, the Unix find command!), for example:
find .. -type d ! -name . ! -name .. -exec ls -l {} \;
(For those not familiar with find, this one finds all directories beneath
the current directory's parent (excluding . and .. names) and does a ls -l
on each one of them).

Each time loading ls worked fine on the ramdisk I used to use, but once I
started working on a hard disk, it becomes really slooooooooooowwww!
Then I decided to preload the ls command (with gemdos(0x4b,3,"ls",0,0)).
The gemdos function returns the basepage address of the loaded program.
Now 'find', each time it has to 'ls', copies the argument string into the
basepage; then it runs 'ls' by gemdos(0x4b,4,0,0,0) (I don't remember whether
these are the correct values for the parameters). It is now (nearly) as fast
as a builtin function!

There are however a few problems (and I have not solved all of them):
1) When the parent program changes directories, the child stays in the
directory
it started in (the current directory and disk are saved somewhere on the
basepage, start+55?).
2) There is also a problem with the memory; the loaded child obtains, as usual
the rest of the memory available (in addresses basepage+4 to basepage+7 the

address of the 'next free location' or something like that is found: 0xF8000 on my 520 ST+). Thus there is a problem with multiple preloaded childs or childs requesting additional memory. I've overcome this (sort of) by using setblock (gemdos 0x4a) and adjusting the 'next_free_location' ptrs on the childs basepages. It's better now, but still buggy (I don't know all about Gemdos memory management, I'm finding out now).
3) There could be problems as well with file descriptors (they're also on the basepage).
4) Initialized static and extern variables do not regain their initial value after a run. This is in consequence of the 'once-only' load. It could be overcome by a) always explicit initializing (by the child process), or
b) make a copy of the initialized data space (by the parent process) and use this to re-initiate from the next time (more expensive, but not breaking existing code).

If you manage to overcome these difficulties, it should not be very hard to code this preloading into a shell (I did it, having still these little problems ...). The shell maintains a list of preloaded programs, their pathname and their fat number and handles loading/executing depending on memory available, programs preloaded etc. Preloaded programs are almost as fast as functions built into the shell.

If anybody has suggestions about the memory management part, or questions 'about the real code', or want examples, please RESPOND! A commented disassembly
of the gemdos part of the O.S. would also be great ....

leo.

I have had some time to figure things out (disassembled Pexec and several others) and managed to get a reusable load image in core that can be run over and over.
A word of caution: the program should not depend on initialized data, unless this data will not change (is 'readonly'). An example:

```
#define INTERACTIVE 1

int option = 0;

main(argc,argv)
int argc;
char *argv[];
{
if ((argc > 1) && (!strcmp(argv[1],"-i"))) {
option |= INTERACTIVE;
}
/* REST OF CODE ... */
}
```

After one run with -i flag option 'has the INTERACTIVE bit set' and will have it too on the next run. So option must be explicitly initialized:

```
main(argc,argv)
int argc;
char *argv[];
{
option = 0;
/* REST OF CODE ... */
```

Before I give the prescription I will give a more detailed explanation of the Pexec call, Pexec(mode,path,tail,env); mainly because most books about GEMDOS are much too terse about the subject (please correct me if I'm wrong, I had to find out things the hard way, like so many of us).
Which functions will be performed within Pexec depends on the mode word; this can be either 0, 3, 4 or 5.
The following actions are performed:
1) mode 0 and 3: searchfile. If the program file 'path' does not exist, Pexec returns error -32 (file not found).
2) mode 0, 3 and 5: 'basepage initializations':
a) create environment string. If 'env' is null a copy of the parent's environment string is made, else a copy of 'env' is made. 'env' is terminated by two '\0' 's. The new environment space is allocated and bp[11] is set to point to it (consider bp a (char **), it is the start of the basepage).
b) allocate program space. The maximum available space is claimed (that returned by Malloc(-1)).
c) If mode == 0, the environment and program spaces are owned by the child

(in the memory parameter blocks the owner is the new basepage); if mode == 3 or mode == 5, the parent owns the memory blocks. This fact ensures that the program area is not automatically reclaimed when the child exits (but space Malloced by the child is).
d) bp[0] is set to the basepage, bp[1] is set to basepage + length of program block (i.e. the first location above the program).
e) Initiate (redirected) file descriptors 0 - 5 (bytes 48 through 53 on the basepage).
f) Initiate current working directories: for each drive one (bytes 64 through 79 on the basepage). Note that e) and f) involves more than simply assigning a value.
g) Initiate current drive (byte 55 on the basepage). This is copied from the parent.
h) Copy tail to basepage + 128 (max. 0x7d bytes). bp[8] is set to point to this location.
3) mode 0 and 3: load program. This is a function on its own, and I will not explain all details. Generally speaking, the function performs some checks on the program format, it loads program and data, does relocation, null fills all above data and sets bp[2]: text start, bp[3]: text length, bp[4]: data start, bp[5]: data length, bp[6]: bss start, bp[7]: bss length.
4) mode 0 and 4: final initializations and run.
a) bp[9] is set to the current basepage (parent).
b) A save area for registers is initialized at the last 50 locations of the program; bp[30] and bp[31] are set to point to this area; bp[26] through bp[30] are for saving other registers.
c) switch process: the new basepage is entered into the long at 0x602c and registers are loaded using the save area and bp[26]..bp[30] mentioned in b).

So far for the 'preliminary meditations'; here's the recipe:

A) First preload using mode 3:
```
bp = (char **)Pexec(3,"program","",0);
```
B) Return unused memory to the system:
Calculate the memory needed, e.g.
```
memneed = 0x100 + (int)bp[3] + (int)bp[5] + (int)bp[7] + 0x800 + 0x800;
```
basepage text data bss heap stack.
(the values needed for heap and stack depend on your program/your needs).
Now:
```
Mshrink(bp,mneed); /* return unused memory to the system */
Mfree(bp[11]); /* free the new environment space, we won't use it */
bp[1] = (char *)bp + mneed; /* first free location is lower now */
```
C) Prepare to run:
```
bp2 = Pexec(5,0,"arguments",0);
Mshrink(bp2,0x100); /* only keep a basepage */
for (i = 1; i < 8; i++) bp2[i] = bp[i]; /* set pointers and lengths correctly*/
```
D) Now run it:
```
code = Pexec(4,0,bp2,0);
Mfree(bp2[11]); /* frees the environment space */
Mfree(bp2); /* frees the new basepage */
```

For each run, do C) and then D). Hey, it works!
Some remarks:
a) the environment is not used (0, so the parent's is used). You can use an environment string, in C): Pexec(5,0,"arguments","environment\0");
note that the environment string must end on a double '\0', as in the example.
b) Although the arguments string is simply copied, it is a convention that the first byte of the args string contains its byte count. This is probably due to the fact that the GEMDOS readline function (0xa) also returns the count in the string (and probably GEM uses this type of string for Pexec when starting TTP applications). So:

```
char newtail[128];

strncpy(newtail,tail,0x7d);
newtail[0] = strlen(newtail + 1);
Pexec(5,0,newtail,0);
```

c) The bp[..] and bp2[..] mentioned are longs (char *, to be precise).
d) Preload could be used to provide more than 128 characters arguments string. The arguments can be placed on the child's stack; the child can find them using bp[8] (this will break existing code that uses simply (char *)bp + 128). I suggest that we use bp[8] as a char *[], as is argv; and use a startup module that uses this scheme if bp[8] != (char *)bp + 128 and the old one if it equals.
e) A similar scheme can be used for the 'env', bp[11].
f) I'm sure d) and e) start up new discussions!

Hope this clarifies some things about Pexec and makes it better usable.
I'm waiting for your responses, questions, remarks, experiences...

Leo (Swimming in the C..)

4288. Arcgsh: New Version 3.0

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 07:20:31 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <2157@laura.UUCP>
Source record: 240930

I would like to announce version 3.0 of Arcgsh.

Arcgsh is a GEM based shell for the popular archivers Zoo, Arc, and LHarc. Besides that you can call the not-so-popular-anymore Shar. A GEM interface to Uud and Uue eases decoding of articles you grabbed from the net resp. encoding files for distribution via net or e-mail.

Main improvements over Arcgsh V2.1c:
- Support of Arc V6.02.
- Support of LHarc V1.13 (posted in comp.binaries.atari.st some weeks ago). I am not quite happy with LHarc because there are several formats of LHarc archive files floating around and still no English documentation is available. Consequently you might not be able to extract every .LZH file but only those LHarc V1.13 can decode. (For other .LZH files Unlzh may be helpful.) Due to the lack of documentation the Arcgsh GEM interface relies on some guesses I made and some options are not (directly) available. Hopefully the situation will get stable some day.

I am still working on the Arcgsh documentation which will be more detailed than the former one. It will be distributed in LaTex format. For those poor souls without TeX an ugly looking ASCII version will be included.

Arcgsh V3.0 will appear in comp.binaries.atari.st within the next few weeks.

WARNING: ***FLAME ON***

Electronic propagation delays are not the only source of monitor
flickering. Pardon me for living, but it sounded to me like a safe
assumption that removing the RF shield could cause RF leakage which
could interfere with a monitor. So I suggested that he try to put it

back on. Is that any reason for you to be snide and flame me? The purpose of this newsgroup is to provide information, not to prove who is the biggest hotshot know-it-all who can make everyone else look stupid. Well, my friend, the only one who looks stupid here is you. Read on...

>

What the HELL does my school have to do with anything? Yes, they teach philosophy here, and yes, we have quite a large theatre department. We also have a math department and a physics department. Are students at liberal arts institutions not allowed to post on matters of a technical nature? Sorry, I must have missed the sign on the door that said "Only engineering students allowed." My signature is there because I like it, it has nothing to do with my school, my major, or what my interests besides literature are. I am a COMPUTER SCIENCE major. Should I have put some really brilliant quote from Niklaus Wirth in my .signature? The only thing that makes someone more qualified than me to post on a subject is if they know more about it than I do, which has nothing to do with my school, my .sig, or whether or not you think you're god's gift to the world of electronics. Grow up.

There is an other pit fall. The 68000 is not able to continue
an aborted bus cycle. So you cannot implement demand paging
easily. If you omit demand paging you need a lot of memory.
And for UNIX 4 MB is really less.

So you have to wait for the day ATARI will offer the TT under UNIX.
(hopefully this day will come and hopefully ATARI will support UNIX unlike
GEM/TOS)

By the way what is about MINIX on ST?

Stefan

From: suhonen@tukki.jyu.fi
Message-ID: <4528@tukki.jyu.fi>
Source record: 240936

Hi!

Is there a way to change directory with a program so that the change
can be seen after the program in desktop (or in a shell; I use gulam)???

I'm writing a program that changes directory with a TOS call (migh be
3F; can't remember). The call returns a 0 (success), but when the program
exits I am again in the same directory where I started the program. This
happens both with gulam shell or with desktop.

I have good old 520ST with 1M RAM and TOS dated 85 (or 86) and I use
Sozobon C version 1.1(?).

[]
|A general solution to the problem that doesn't break any rules or make
|assumptions about future TOS's is unknown to me. True, that if one
|has a shell that uses ARGV and if one's compiler inserts
|ARGV-compatible startup code, all is fine. Not all shells and
|compilers cooperate.
|
|Dlibs uses a method (with uncooperative shells) based on accessing the
|stack of the parent process (assuming there is one) to see what name
|it supplied to the Pexec(). It works but it looks kind of fragile
|unless Atari has sworn not to alter the key components.

This does not work with Pexec(4,...), since that call doesn't even
use a program name. It seems to prevent any fundamental solution to
the problem (other than to fix GEMDOS, but that is a fundamental one).

|
|There does appear to be a reserved slot in the basepage at offset 40.
|Perhaps this was originally intended to point to prog name. It would
|have been nice.
|
|P.S. I tested my 'procedure' and got a nice virgin-looking dta - all
|zeros.

Of course; the initial dta starts at the same address as your program's
argument string! That's why your assumption about the dta was wrong in
the first place (Fgetdta() gives the process' own disk transfer address
- initialized by GEMDOS to point to the same address as the program's
argument string -, not that of the parent).

>relocation data (last word in GEMDOS header == FFFF)

this is because in writing a $FFFF into the last word of the header, you are toggling the TOS 1.4 fast file load bit, which ends up doing EXACTLY the same thing like PINHEAD, but with less problems since this is an actual feature of TOS 1.4, rather than a patch program like pinhead. (correct me if i'm wrong - with a 1040, you can't really notice any difference, although people with 520's claim that pinhead speeds things up enormously - more a placebo effect than anything else i think!)

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have little
desire to read about that neat bit of [hard/soft]ware you're selling when you
live in the U.S.A. If you don't know how to restrict distribution of a posting,
ask your systems administrator.
```

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?

There is an FTP source and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

For anonymous FTP: terminator.cc.umich.edu [35.1.33.8]

User anonymous
<enter password>
cd /atari

Most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For the panarthea mail server, see Steven Grimm's monthly posting. Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

How do I deal with Archived files (.ZOO, .ARC, .LZH)?

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from terminator, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on terminator in the /atari/archivers directory. They are:

arcgsh21.arc - European in origin
arcsh197.arc - US in origin

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear
while you are operating your ST computer. This first list gives you
the GEM error messages:

Error description GEM Error code
==========
OK (no error).....0
Fundamental error.....1
Drive not ready.....2
Unknown command.....3

Where can I get copies of ST Report and ZNET?
==========

ST Report and ZNET on-line magazines are available on CompuServe and GEnie.
You can also get copies mailed to you by sending an e-mail message to

streport-request@virginia.edu
and
stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ST Report, ZNET and some information from the Current Notes user magazine are
also available from the terminator archives under /atari/magazines.

ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net

access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his e-mail or paper mail address if you are interested.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

==========

I would like to thank those who sent messages with suggestions and comments about my initial posting. I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

4296. Re: ST World (UK)

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 14:04:29 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1990May14.140429.12266@newcastle.ac.uk>
Source record: 240947

I have let this go to the world as there are some readers in the States.

Is there nothing that can be done? Would posting to the ST world mail address help? (stworld@cix.uucp) or is answered by contributors like Mathew Lodge who seem not to have any idea what is going on either? Did the mag make money? I would have thought so since out of 10 people who purchased ST mags only one bought a different mag (ST action he was a games man.)

I am as you may guess a little no a lot upset!!

Dave H.
(D.C.Halliday@newcastle.ac.uk)

4298. Pinhead and Gulam

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 15:14:48 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <23085@eagle.wesleyan.edu>
Source record: 240948

I am using Gulam version 1.03.06.07 beta. When I use the shell, Pinhead does not auto-disable when I run one of the programs listed in my PINHEAD.DAT, so I have to manually disable it using the keyboard command control-alt-shift 0. Is there any way to get PINHEAD.DAT to work within Gulam? I have no trouble when starting programs from the desktop. Is this a problem with Gulam or with Pinhead's method of recognizing what program you are running?

thanks,
nick

4301. Status displays at the TOP of the screen??

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 16:49:47 UTC
From: ajy2208@ultb.isc.rit.edu
Message-ID: <3148@ultb.isc.rit.edu>
Source record: 240945

Hi again..

I must thank everyone who replied to my request for information about creating non-scrolling regions in a TOS program. However, I have only been able to successfully create a non-scrolling region at the BOTTOM of the screen. While this may be fine for some applications, I need to create a 5 line display at the TOP of the screen.

The reason I'd prefer it to be at the top of the screen is that your eye follows text from where it appears at the bottom, and it will be easily distracted if there are several lines of text below it. Since the top of the screen is where text scrolls off, you are less likely to be bothered by a window up there (IMHO).

The method I used to create a region at the bottom was to subtract the number of non-scrolling lines I wanted from V_CEL_MY, and whenever I wanted to write something to that region, I would modify V_CUR_CY (and V_CUR_CX if needed) to put the cursor in that region. Using Bconout, I can then write text to that area. When I'm done, I set V_CUR_CY/X to their previous values, and proceed as before.

What I __don't__ want to resort to is have to blit the area I want to scroll. I suppose the OS has to do this anyway, but it does it in low-level ML code. I took a look at the MWC linea.h header file, but it's not documented very well (I really didn't expect it to be). There were a few terse comments about Atari changing variable names though.. :-)

We (Robert Costello and myself) do plan to register as a developer this summer, when we can spare the $300. Until then, the net is our most valuable source of information (well, that and the MWC manual), and we greatly appreciate the help we've received.

I have been using PINHEAD with my 520 for quiet a while now and found a drastic increase in time saved during bootup. I still found this same increase when I upgraded to 1 meg and to 2.5 meg. Yes I am using an older version of tos but there was no difference in the time it took to boot with PINHEAD based on ram available.

4303. comp.sys.atari.st.tech vote does NOT violate the guidelines

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 18:40:59 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May14.184059.6530@wam.umd.edu>
Source record: 240946
Cross-posted to: news.groups,comp.sys.atari.st

People have been sending me NO votes with comments like "this vote doesn't follow the guidleines."

Look, people, I read the guidelines and I've followed them to the letter. My original post to news.announce.newgroups may not have made it to lear@turbo.bio.net, but then why in the hell did it take a week to get moderated and show up in the groups? Someone's made a mistake here, and it's not me. Probably a mailer somewhere. The fact is we had the requisite call for discussion; it lasted _more_ than the minimum time. ALL relevant discussion was posted in news.groups. Everyone who has been following this knows damn well it's been by the book.

Give me a break, guys. If you like the idea, vote YES. If you don't vote NO. But don't vote NO because you haven't been following the discussion and misinterpret lear's comment.

(Yes, I'm mad.)

Dave Baggett
dmb@wam.umd.edu

4304. wanted, 68000 filled polygon code

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 19:01:41 UTC
From: gjocc@csv.viccol.edu.au
Message-ID: <6203.264eba46@csv.viccol.edu.au>
Source record: 240932

I am currently writing a game in compiled STOS BASIC (yuck why
didn't they write STOS 'C' or STOS Pascal?).

I find that the STOS polygon instruction is too slow for
my needs (It probably just uses LINE A?).

Does anyone out there have a fast 68000 assembler routine for
drawing filled polygons?

I dont even need a general routine, just low res, solid fill, four vertices,
and blinding speed.

Help, I haven't written any 68000 assembler before.
(although I did write some Z-80 assembly code years ago :-).)

Greg O'Sullivan (gjocc@csv.viccol.edu.au)

4305. misc.forsale.computers -- CALL FOR VOTES

Newsgroup: comp.sys.atari.st
Date: 1990-05-14 19:45:50 UTC
From: raymond@math.berkeley.edu
Message-ID: <1990May14.194550.6286@agate.berkeley.edu>
Source record: 240950
Cross-posted to: news.groups,comp.sys.ibm.pc,comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,comp.sys.apple2

```
[I know the review period was over the weekend, but I have to get
this out before the 28-day deadline expires, if it hasn't already...
A copy of this article has been forwarded to Mr. Lear for posting in
news.announce.newgroups.]

Call for Votes: misc.forsale.computers.

Voting instructions appear at the end of this article.

------------------------------------------------------------------------------
One-line description:

misc.forsale.computers
Short, tasteful postings about computer items for sale.

------------------------------------------------------------------------------
Charter:

Misc.forsale.computers is devoted to short, tasteful postings about
computer items for sale. All standard guidelines for "for sale" items
apply. No discussions, please. This charter and the following
guidelines will be posted periodically.

------------------------------------------------------------------------------
General guidelines:

[1] No crossposting into comp.anything.

[2] Restrict distribution as much as possible. Restricting to the
country is almost certainly a must, since customs are often a major
problem. Restricting to the state or other local geographical
region is probably a good idea if the object is large and shipping
would be a concern.

[3] Include your telephone number (and possibly postal address) so that
people who can't negotiate email paths can still contact you.

[4] Do not post "I've sold it" messages. If you have sold it, cancel
the original message. If you don't know how to cancel a message,
ask your local news administrator.

[5] Make the subject line as clear as possible. If your item is meaningful
only for a particular machine, put that machine's name in the title.
That way people can set up KILL file entries to weed out articles
that they don't care about. If you'd like to set up a KILL file,
ask your local news administrator to teach you how to do it.
------------------------------------------------------------------------------
```

How to vote:

Send electronic mail to raymond@math.berkeley.edu with the
subject "Vote" and whose body contains two words: "vote yes"
or "vote no". A computer program will be tallying the votes
and sending vote acknowledgements.

Gentle reminder: The subject of the mail must be the word "Vote".

Meta-voting replies (e.g., "I sent a vote but got no acknowledgement.")
should be sent to the same address, but with the subject "voting help".

Example vote:

To vote from a well-connected UNIX-like system, choose one
of the following:

```
echo vote yes | mail -s Vote raymond@math.berkeley.edu
echo vote no | mail -s Vote raymond@math.berkeley.edu
```

Voting ends on 4 June 1990.

Yep, and the Portfolio. I think you will see Atari making most of their
near-term profits on these gadgets (if there are any profits...the jury is
still out on that one). Making and marketing little gadgets seems to
be Atari's strength so I'm not so sure why they continue to linger
in the PC market. Anybody have any insight on this?

For return on investment, 4.48% isn't too bad for a single day. :-)
3/8 for 7 dollar stock is phenomenal.
I wish I'd dumped a few thou on CBM last week.

I just recently got a Master 3S drive, and I've been having the same problem.
Some results of this have been annoying (having to open drive A before reopening
drive B), and some have been alarming (One of my disks was reported to have a
total of 171000000 bytes used, another told me I was using -52000 bytes!).
I, too, am wondering how this will affect me.

I ordered the drive because it was relatively cheap, and I wanted a DS drive
to supplement my SS internal (520STfm), which has been acting up on me.
Sometimes when I cold boot it will read the disk, reboot, read again, reboot...
After a couple of tries I usually can get it to work okay. Also, it does not
like reading any disk that is formatted past 80 tracks 10 sectors. One thing
about it that is really weird, is that some disks that it can read okay, no
other drive can seem to read (including my Master 3S and my friend's Atari 314).

I remember someone asking on the net a while back about cold booting from Drive
B with an internal drive, but at that point I was a one-drive person. Can
some kind soul please repeat the information.

I'd really appreciate all your help...

4313. N_MenTim, a review.

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 02:59:59 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <1990May15.025959.24954@water.waterloo.edu>
Source record: 240807

I tried the tiny program called "N_MENTIM.ACC" by Noud van Kruysbergen and find it to be delightful. This little jewel is a desktop accessory that gives the date and time on demand from the "Desk" drop down menu. If you go so far as to click on the zone that shows the date and time, you will get a little message that shows the version number, a copyright statement, and the name of the author, Noud van Kruysbergen. The name, N_MenTim, stands for "MENu TIMe".

When I first got my Atari 1040 ST, I received a little program called BREAKOUT.ACC. This accessory always had the same name, "Breakout", in the popdown menu. Since then, every accessory I have had has had a name that is unchanging. This jewel, on the other hand, has a name which is always changing, minute by minute, and and its name tells me the date and the time. Noud said that he wanted the date and time to show up whenever HE wanted it to show up, at the touch of the mouse. One of the earliest corner clock programs I had was a real cpu hog, updating the clock display frequently. Noud says that his program updates every 5 seconds, and provides no measurable delay in other programs.

I think that this is a first, changing the name of the accessory on the fly, and it is a highly creative invention. Congratulations Noud!

I wonder if I will still be using my Atari 11 years from now. Maybe yes, maybe no. But if so, I might still be using this wonderful program. This brings me to my only criticism of the program, and that is the format of the date display. Noud has chosen a format that he finds natural. Today, N_MenTim shows "14/05/90", and there is no ambiguity about this particular date. However, some Americans might prefer "05/14/90". On the other hand, I would prefer 1990-05-14, which is the sequence of the ISO format for dates. It fits nicely with time, yyyy-mm-dd hh:ss because largest unit (year) is on the left and smallest unit (minutes) is on the right. I wonder if after the year 2000, will folks be still be writing things like 05/04/03 ?? I hope not. What ISO has standardized is the idea that one writes out the full number of the year (at least for the first 32 years of the century) and then a date string like 2005-04-03 will not be mis-interpreted.

4314. Ethernet adapters for Atari ST

That particular desk accessory has an insidious bug. Whenever you clear the board and still have balls left (or is it just on the first ball...), it freezes up the whole computer. Yuck! Maybe there's a way to unfreeze it, but I never found it. So I dumped it. Too bad, though; breakout was fun in the middle of a long word processing session.

The NEC handheld is NOT "far superior" to the Lynx. It is simply a TG-16
on a very small screen. The storage is much smaller, the sprite engine is
about 1/1000th as powerful, and the sound is not even close (though it has
more voices).
TG-16 sprites are hard enough to see on a 14" screen when they flicker, I
can't imagine it on a 2" LCD screen! :-)

The last I heard is that NEC has put it on indefinite hold due to the
projected cost of the unit.
Where on earth did you hear the Atari Games was going to market the tg portable
and don't you think that with the tg-16 and sg-16, NEC would want to market it
themselves?

There are two flags in the header to speed things up: One is documented
(the fast load bit) and one is not. The latter prevents GEMDOS from
relocating your program and clearing the BSS. It isn't documented
and official, so you shouldn't use it. Use the fast load bit instead.
(Remember: It is just a bit, don't fiddle with the other bits in the
related longword; other bits of this longword will probably be used
for the TT's more complicated memory management, allowing you to
choose whether mallocs shall be satisfied from FAST RAM rather than
from ST RAM. At least I suppose this longword is reserved for things
like that. I've seen many fast load bit togglers that just write
a $01 into the header instead of getting the old value, ORing it
with a 1 and writing it back.)

> to their previous values, and proceed as before.
>

It isn't this difficult. All you need is to play around with the logical
screen address. To make a 'safe' area at the bottom, subtract a few lines
from it. To make a safe area at the top, you even don't have to do anything
as the VT52 emulator scrolls only the bottom of the screen if you delete
or insert lines in the middle of the screen. For portable code this last
method is by far superior, because VT52 terminals don't have a scrolling
region and many termcap files don't have the scrolling capabilities in
for vt100 and up. In the newest release of the termcaps some of it has
been added (some people must have complained) but not all.

If you don't have the VT52 codes you may look around some of the archives.
They have been posted a few times.

Good luck

Jos Vermaseren

4323. ftp for serial port?

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 09:21:12 UTC
From: t19@nikhefh.nikhef.nl
Message-ID: <849@nikhefh.nikhef.nl>
Source record: 240815

I know this has been asked ~ 1.E6 times, but:

Does anyone know of or has used an ftp program for use over the serial
port? Kermit is heavily disliked by the other users of the network.
At 19.2 KB it stops all others terminals on the same terminal server,
maybe ftp is adapted more to an ethernet enivironment.

Thank you, Geert Jan van Oldenborgh, NIKHEF-H.

|EXACTLY the same thing like PINHEAD, but with less problems since this is
|an actual feature of TOS 1.4, rather than a patch program like pinhead.
|(correct me if i'm wrong - with a 1040, you can't really notice any
|difference, although people with 520's claim that pinhead speeds things
|up enormously - more a placebo effect than anything else i think!)

a) The fast load flag was already there in older versions of TOS (probably from 1.0) on. In those versions a bug existed: the file descriptor used for reading the executable into memory wasn't closed. I trust Allan & companions to have fixed this in 1.4.

b) For executables with that flag on you get exactly the same behaviour, probably because pinhead isn't activated then (pinhead is looking from a VBL routine whether the saved PC is in the range of the ROM code that clears memory). I said probably, since I don't have the source code to pinhead; things may have changed since I wrote an anchestor.

c) Since most programs really need the relocation, they can't use the fast load flag. In this case - the most often case - GEMDOS will still clear all of the process' memory; much faster than in the old ROMs, but still in the order of second(s) for a 4MB machine. Backward compatibility. Pinhead will only clear all of BSS; the difference in speed you get is most certainly not a placebo effect (for a small program most time is in clearing the memory; loading it takes less).

Leo.

Message-ID: <1990May15.120156.9197@cs.wayne.edu>
Source record: 240820

I screwed up an installation last night, and to retry the installation I have to remove all the files and directories. However, the directories are all set "read only" and I hav no utils to remove them. Anyone used a utility to remove these, or does anyone have a "chmod" for the ST that works on directories (the one in Mark Williams msh doesn't)? I've already tried diskmech, Poole's DIII, and one other one I can't remember.

Thanks folks.

I guess the PCs are merely made for cashflow; overmore, they might
serve to keep in touch with the PC technology in case something goes
wrong with the ST or TT series. You can develop PC clones very easily
compared to a TT or even to a Lynx.

>all the rf shields left off. The ZRAM sits right on top of the video
>shifter.

Just wanted to say that I recently upgraded my RAM with the
Tech-Specialities Co memory upgrade. I am very happy with it. If I have
PinHead running I never notice a difference in its operation (except
that I have tons of accs and TSRs on, and still have over a megabyte
of free memory! yahoo!).

This was installed by RF-Microtech in Billerica, MA, and they did an
excellent job of it, testing the damned machine for (they say) an entire day
before telling me to pick it up again.

A little note: They were installing z-ram boards but they had much too
much problems with them, and very rarely could get a computer working
fully with the damned board in. This is why they are now installing
T-S boards.

So if you can still send your computer back and get a refund on the
ram board upgrade (after all, your's is defective) then get a
Tech-Specialities board. It is really nice - my computer doesn't even
heat up!!! Apparently there is also a battery-backed up clock option
included with the board (which I never bothered with since I have one
on my hard drive).

Hi All,

I picked up Spectre GCR at the Toronto Atari Show, and am having problems trying to read Mac disks. GCRTST shows a failure on the drive test with all sector/rate combinations. I can get to the Mac screen without any problem, so I don't think it is the EPROM installation.

The cable that I got was very loose, initially, but after trimming some of the plastic from it, it now fits snuggly.

Does anyone have any suggestions?

advTHANKSance

Here's a comment I want to address publicly:

John F. Haugh II <jfh@rpp386.cactus.org> writes (to me):

>One, I think you are an anal retentive asshole for having such assinine
>restrictions on your voting procedure. Clearly you are trying to force
>the vote to pass with the stupid subject line. How many people do you
>expect to notice the two spaces after "NO" and actually type both in?
>
>Anyway, that said, I am voting "NO" not because you are a total twit,
>but because I think all the PeeCee's on the net belong in pc.* and not
>in comp.*.
>--
>John F. Haugh II UUCP: ...!cs.utexas.edu!rpp386!jfh
>Ma Bell: (512) 832-8832 Domain: jfh@rpp386.cactus.org

Well, even if I AM an anal retentive asshole (an interesting trick, if
you really think about it), I didn't intend the meaning derived here.

Obviously, votes with similar-enough subject lines count too. My vote
logging/tallying script looks for all messages in my mailbox with
"YES", "Yes", "NO", or "No" in the subject line. I use grep -- how
amazingly novel! The spaces after "NO" were put in there for no
particular reason at all.

My strict tone of voice in the call for votes was:

1) to prevent people from entering votes via news
2) to prevent people from entering ambiguous votes
like "yeah" or "uh-huh"

for EXACTLY the reason that I didn't want stuff like this to get started.
You can't win, I guess.

(But it sure is nice to know he's not voting "NO[space][space]" just because
I'm a total twit!) :-)

> ^^^^^ this is about 3%
>
>Why is C= "kinda blah" at a 5% increase, while Apple is "Yowsa!" with 3%?

Many people have trouble understanding this. Brokers charge you
commission on a per share basis. Much of a 3/8 increase would
be eaten by the commission you would have to pay to take that
profit. Therefore, a $2 increase in a stock that costs $50
is much more profitable for an investor (in the short-term)
than a 3/8 increase in a stock costing $7. As the increase in price
of the lower cost share gets larger, this lower jump in price can be
counteracted as you can buy many more shares of a CBM than you
could buy of a stock like Apple. So in this respect, owning stock is
different from say putting your money in the bank in that there is
a cost associated with changing your asset from stock to money.
This cost is an absolute (x amount per share) rather than a
percentage of the money you have invested.

Does this make sense to you? Maybe I'm not doing a great job
of explaining this?

>
>Things are looking great for Motorola, Apple and Sun! Let's hope
>that other computers with Motorola engines join the bullish bandwagon.

Let us analyse this for Chris --

>Apple Computer 42 5/8 +1 1/4 <---a definite BUY Yowsa!

Apple up 2.93255%

>Sun Microsystems 29 3/8 +1 1/4 <---ditto (i.e. a definite BUY Yowsa!)
> look for 2 point jump tomorrow

Sun up 4.2553191%

>Commodore 7 3/4 +3/8 <---kinda blah

Commodore up 4.8387%

Interesting stock purchase rationale you use Chris. You would call a
2.9 - 4.25% increase a "definite buy" but a 4.84% increase "kinda blah".

Message-ID: <3288@rodan.acs.syr.edu>
Source record: 240828

DCSoftware indicate in their manual that there are problems with screen clocks and that they are working on one that will work. Glad to hear that and I'm looking forward to seeing it. Until then I've found that I can use dcclock.prg (if loaded from auto folder, it disables quickstII's speed up of gem redraws [I've already informed brasoft about this]...but it can be run from the desktop without any problems). Trying to load dcclock.acc, either on bootup or via stuffer, causes the system to bomb.

4336. deleting programs from autofolder under dcdesktop

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 15:14:44 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3289@rodan.acs.syr.edu>
Source record: 240829

I've run into a serious problem while running dcdesktop...the only question is whether this is something I'm doing, or something the desktop is doing. I have a 1meg 520ST with tos 1.0. I've got a 20meg hard disk and I have autoboot set from drive c:. I've got the path set for dcdesktop to "c:\dcdsktop\" and the path set for trash to c:\trash\, and the appropriate folders are located where they belong. Also, the problem I'm about to describe occurs with the trash toggle set either way, i.e. "control" causes delete OR "control" causes copy to trash folder. Here it is:

In trying to determine the makeup of the system I want, I was going to try to play around with the contents of the autofolder. When I tried to delete certain programs from the autofolder, however, the following message was displayed: "An item with this name already exists in the directory, or this item is set to read-only status." The programs are not set to "read-only" status, but I tried changing them to "read-only" just to be sure...no good. Also, I checked the "trash" directory, and it is empty. Finally, this only seems to happen to some programs, e.g. dcdesktop, dcshow, dcclock. I believe I had the same problem with non-dc programs, but I don't want to say which ones, because I don't remember. The only way I've been able to get a new auto folder is to copy my c: partition to my d: partition, zero the c: partition, copy the d: partition without the autofolder back to the c: partition, and then zero the d: partition--then I create a new auto folder in the c: partition.

Anybody out there have any ideas about this? Or has anybody out there had the same problem? Or does nobody else with dcdesktop have this problem?

I really LOVE the things I can do with dcdesktop, I just hope I'm doing something wrong in this instance (and that someone can and will tell me what it is). Thanks very much in advance. Post to the net or email me directly.

I assume you did select the "Autoboot HD" option in the hard disk menu. (I used to handle tech support at Data Pacific, it was amazing how many people forgot to do things like select the option they wanted in the menu or didn't bother to plug in the cables since they didn't know what they were for.) If you do have the "Autoboot HD" option selected Spectre should try and load System/Finder from the first hard disk partition you have selected (ie. checked in the lower portion of the HD menu). If it doesn't then there probably aren't any boot blocks on the hard disk. Try copying System/Finder from a boot floppy to the hard drive, that should cause it to write new boot blocks on the hard disk partition.

You might look into the KA9Q tcp/ip package which is used on amateur
radio. I've been running Telnet,smtp,ftp and finger out the serial
port of my ST for several years now. There is also support for faster
data rates out the MIDI port.
Check the archive sites for both sources and executable.

Based on my experiences and a lot of other peoples comments, if you are having
irratic and unexplained problems when using NeoDesk the problem is most likely
the print spooler desk accesory. To illiminate your problems just remove
NEOQUE.ACC (if that isn't the name then it is something close to it) from your
top level directory. You will still be able to print files by dragging file
names to the printer icon, it's just that you will have to wait for the
printing to complete before doing anything else.

Well, that is for sure what most "full" brokers do. Go to a good discount broker and that won't be the case. Take Pacific Brokerage Services for example, I could buy 300 shares of ANY stock at any price for a commission of $25. And you DON'T need a full broker, when you make your investment decisions yourself.

Above 300 shares, PBS will charge the SAME commision on stocks valued $10 or above ($78 for 1000 shares, for example). When buying stocks that cost less than $10, I actually get to pay a LOWER commission.

Bottom line: it pays to shop around even for brokers.

4343. TECH: GEM desktop with no icons, why?

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 18:32:55 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <6017.26501318@uwovax.uwo.ca>
Source record: 240836

What kind of (software) problems could cause the GEM desktop to come up without any disk or trash can icons? I'm trying to boot GEM from a multi-tasking operating system (which ran from an AUTO folder, so GEM isn't active yet). The desktop comes up quite normally, except that there are no icons. Menus work fine, as do the various dialog boxes; but for some reason the desktop doesn't recognize my floppy or hard drive. I presume that one of the GEMDOS or BIOS calls isn't being emulated correctly; but the weird thing is that I start GEM from a shell, and the shell was working fine and recognizing all of the drives. Booting the multi-tasker from GEM also works, and doing "dm" from Gulam produces the expected results. Finally, starting GEM with no multi-tasker also works fine, i.e. the program I use to start gem (just does a Pexec(5,...) and then Pexec(4,...)) is correct.

Has anyone looked into the internals of the desktop enough to give some clues (like, "the desktop does strange things with its parent's basepage") about why this isn't working, or what system calls might be failing?

You are confirming what I told you. Use the $25 fee for 300
share formula math with the numbers in my original post. You will
see that CBM and Atari provided teency weency profits compared
to the other stocks. Anyway, this is getting very far off the subject.
Further queries to email please.

I have trouble understanding this as well. My broker (my bank, actually) bases its commission on a percentage of the money invested, rather than based on number of shares. I believe that most discount brokers work on this basis, actually.

Good thing, too, otherwise it wouldn't make sense to buy the low priced stocks!

| up enormously - more a placebo effect than anything else i think!)
|

From the standpoint of a user (since I don't know much about how Pinhead
works vs. the fastbit in Rainbow TOS), I would comment that my experience on
my Mega 2 is that Pinhead is compatible with everything I use. The fastbit
seems to be inconsistent with some of my applications (specifically, Interlink
comes to mind). Also, I think Pinhead is more convenient to use since
executing once at boot-up speeds up *all* subsequent file executions.
This is much more convenient than setting the fastbit manually.

>This cost is an absolute (x amount per share) rather than a
>percentage of the money you have invested.

This is mostly false information:

Quoting from my commision sheet:
Fidelity Brokerage
Transaction Commision Rate

0-2500 $25.75 + 1.6% of principle
2501-6000 $50.75 + .6% of principle
6001-22000 $68.75 + .3% of principle

Minimum charge $.085/share on first 1000 shares plus $.04/share
thereafter.

Maximum charge $48 for first 100 shares plus $.49/share
thereafter
All stocks subject to minumum $36 charge.

So let's compare $10000 of $7 (cbm) stock and $10000 of
another $50 stock.
7$ 68.75 + .003 * $10000 = 98.75$
Minimum of 8.5c/share at 1428 shares = $121
So to sell those shares would cost $121

50$ 68.75 + .003 * $10000 = 98.75$
Mimimum of 8.5c/share at 200 shares = $17.00
So to sell those shares would cost $98.75

The gross profit:
200 shares with 2$ profit/share is 400$
1428 shares with .375$ profit/share is $535.5

subtract commission and my net profit is
7$ stock $535 - $121 = $414
50$ stock $400 - $99 = $301

The 7$ stock made me 33% more than the 50$ stock.

>Does this make sense to you? Maybe I'm not doing a great job
>of explaining this?
>

Hope this spells it out clearly.

As far as I know, the gulam shell supports a command
chmod +w file
which allows you to set the write access bit.

4350. RTX / MT C-Shell TTY Driver specs

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 22:07:32 UTC
From: david@bdt.UUCP
Message-ID: <2601@bdt.UUCP>
Source record: 240840

I received enough requests for this via mail that I thought I
would post it.

These are the specs. for an MT C-Shell compatible RTX device driver
for a TTY (login) device. This defines the rules for doing stuff
like setting DTR, waiting for DCD, etc. in a device independent
fashion, using the device driver d_cntrl() function.

RTX does not specify the details of what d_cntrl() should do. This
defines what MT C-Shell expects of a TTY device driver which is
to be used for MT C-Shell logins (getty) and UUCP (uucico). This
document describes the interface from the device driver writers
perspective. To use it from the application's perspective, just
turn things around.

=== CUT HERE ====== CUT HERE ====== CUT HERE ====== CUT HERE ===

MT C-Shell TTY Driver Documentaion

Confidential
Copyright (c) 1988
Beckemeyer Devleopment Tools

MT C-Shell tty drivers can support d_cntrl() functions if
desired. They will work as a simple "raw" uncontrolled
tty device if the driver simply returns 0L to all d_cntrl calls.

If the driver implements d_cntrl(), the format for MT C-Shell drivers
is that a termio data structure is passed to the driver:

```
struct termio {
int t_cmd;
int t_baud;
int t_mask;
int t_flags;
};
```

The t_cmd element is used to determine the control function which
may be:

```
/* tty commands */
#define TTY_CONF 1
#define TTY_OPEN 2
#define TTY_CLOSE 3
#define TTY_DCDWAIT 4
#define TTY_STAT 5
```

The TTY_CONF is used to set the baud rate and rs-232 params,
it uses the t_baud and t_mask fields of the termio struct as
in the Rsconf() GEMDOS call. E.g. to set the baud to 9600
without affecting the mask, an application would use:

```
struct termio termio;

termio.t_cmd = TTY_CONF;
termio.t_baud = 1;
termio.t_mask = -1;
d_cntrl(dev, &termio);
```

TTY_OPEN is used to open the line for outgoing calls by programs
like UUCP. This should fail with a non-zero value if the line
is currently opened by another process.

TTY_DCDWAIT is used to by applications (e.g. getty) to wait for
an incoming call. The process should be suspended until an
incoming call is received and the line is available.

TTY_CLOSE ends use of the tty line by the application. The RTS
line should be lowered for a few seconds and then raised to
reset the modem; the line should be marked as clear.

TTY_STAT is used by applications to detect carrier. The call
should return -32 iff carrier is *not* present.

If all d_cntrl() calls simply return 0, the system will work.
The implementation of the above commands depends on the use
of the device and its line. Behavior with modems connected
may need to be different than with 3-wire terminals in order
for it to work. You should be able to test the basic driver
functionality by implementing a simple d_cntrl() which returns
0 first, before attempting to implement all of the tty control
functions.

=== CUT HERE ====== CUT HERE ====== CUT HERE ====== CUT HERE ===

The idea is that the application would use either TTY_OPEN or
TTY_DCDWAIT to access the line. When finished, TTY_CLOSE
should be used. TTY_STAT can be used to determine the status
of DCD.

If TTY_OPEN is used then the status of DCD is "don't care" at
the driver level -- the driver will not react to changes in DCD
(similar to UN*X NOHUP). This is also the situation when the
line is used without any TTY_OPEN or TTY_DCDWAIT d_cntrl().

If TTY_DCDWAIT is used, the processes using the TTY will be killed
when carrier goes away (hangup). This happens in the driver. The
driver doesn't have to impelement this hangup handling, in
which case TTY_DCDWAIT acts just like TTY_OPEN.

What follows is some sample code that uses the d_cntrl calls.
The hangup() routine does the close. The opentty() opens

the line and sets the baud/parity.

```
=== CUT HERE ====== CUT HERE ====== CUT HERE ====== CUT HERE ===
static int xbaud, xdev;

hangup()
{
struct termio termio;

termio.t_cmd = TTY_CLOSE;
d_cntrl(xdev, &termio);
}

int bdtbl[] = {
19200,
9600,
4800,
3600,
2400,
2000,
1800,
1200,
600,
300,
200,
150,
134,
110,
75,
50,
0
};

setbaud(baud)
int baud;
{
int *b;
struct termio termio;

/* set the baud rate */
for (xbaud = 0, b = bdtbl; *b; b++, xbaud++)
if (*b == baud) {
termio.t_cmd = TTY_CONF;
termio.t_baud = xbaud;
termio.t_mask = -1;
termio.t_flags = -1;
d_cntrl(xdev, &termio);
return(0);
}
return(-1);
}
```

```
/* set parity to odd, even, or none based on argument as follows:
* n == 0 no parity
* n > 0 even parity
* n < 0 odd parity
*/
setparity(n)
int n;
{
int ucr;
struct termio termio;

/* div by 16, 1 stop bit */
ucr = 0x88;
/* parity means 7-bit */
if (n)
/* n > 0 means even */
ucr |= (n > 0 ? 0x26 : 0x24);
termio.t_cmd = TTY_CONF;
termio.t_baud = xbaud;
termio.t_mask = ucr;
termio.t_flags = -1;
d_cntrl(xdev, &termio);
}

opentty(ttynam, baud, ttycmd)
char *ttynam;
int baud, ttycmd;
{
int fd;
struct termio termio;

if ((fd = Fopen(ttynam, 2)) < 0) {

4351. "AUTO-FOLDER BLUES...!"

Newsgroup: comp.sys.atari.st
Date: 1990-05-15 23:21:39 UTC
From: nikonf@diku.dk
Message-ID: <1990May15.232139.28861@diku.dk>
Source record: 240838

I am posting this for a friend.

... who owns an Atari Stacy 2.
This machine has a 44 Mbyte harddrive - SCSI protocol i believe.

My friend, who is a curious soul, has had the marvelous idea to place
some binary object in the harddrive AUTO FOLDER called "Revolver" OSLT - the
result of which being somewhat unpractical: During boot the harddrive
functions normally UNTIL the moment when this Revolver thing is run. When
this happens, the screen goes black and user control is lost.
Just before blackout we get the HD driver message on screen so the drive
itself is up and running before things go wrong.

What bothers my friend now is the following little problems:

1) How will he (or will he indeed) be able to remove Revolver from the folder?

2) How come is seems we can't even format the hole thing again?
... yes we have been in the phase of despair...

Concerning 2): We have used increasingly drastic utilities to try to get
hold of the harddrive ranging from HD-SCAN to HDX and HINSTALL.
None of these seems to accept the presence of a harddrive
at all. We boot from floppy of course when we try this and we
have the AHDI.PRG in the floppy AUTO-FOLDER.

What's going on?
That is the question.

Anybody with knowledge, hints, ideas: Please e-mail your responses.
Thanx in advance.

- Morten.

Gerry -

Thanks for your notes. We are currently testing a new clock for the ST. It is quite unique, and unlike any other. When it is available, we will post it to the net. It works much better with programs like Flash, DC SHOWIT, Shadow, ST Writer, etc. where you will get clock images scrolling on the screen.

Gerry -

To delete the programs you speak of, simply rename them to a .PRX and reboot so they don't run. Then you can delete them. This is actually a bug in the TOS OS when you right programs that don't have a relocation fixup table. We have solved this bug and the fix will be in the updated programs. For now, simply do as I suggest above.

For goodness sake, if you ever have a problem with our software, call us before you do anything as drastic as zeroing a partition! We are available at almost any hour.

4354. Re: TECH: GEM desktop with no icons, why?

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 01:39:02 UTC
From: uace0@uhnix2.uh.edu
Message-ID: <1093@uhnix2.uh.edu>
Source record: 240851

The question is why would the desktop come up with no icons.

Since I've done a lot of work with the GEM desktop lately <grin>...

My experience tells me that the problem is caused by reading a zero (0) byte DESKTOP.INF file. Or, you might have a related problem, where the file is not being read correctly. If no DESKTOP.INF file exists, a default desktop will come up, but if one is found and is bad, you can get weird to no desktop.

I'm not sure what your multitasker is doing, but be certain it doesn't bypass the construction of the DESKTOP.INF in memory.

>
> Does anyone know of or has used an ftp program for use over the serial
> port?

Yes, I use Phil Karn's SLIP as ported to the ST by Howard Chu. The code
was obtained via anonymous ftp from flash.bellcore.com and recompiled to
remove some stuff I didn't need.

I then had problems with my machine crashing if I ran anything between a
reboot and starting SLIP. This was eventually traced to a couple of memcpy()
calls which did not include the required length parameter on the calls. I
forget which module this was in, but it was ST specific.

>
> Thank you, Geert Jan van Oldenborgh, NIKHEF-H.

You're welcome...
Pierre Fortin
fortinp@bnr.ca (Use this address, the machine may vary...)

P.S.: The most SLIP use I made of this fine package was simultaneously
running a couple of telnet and three ftp sessions.

4356. KA9Q/SLIP help needed!

From: kibo@pawl22.pawl.rpi.edu
Message-ID: <&##$NM*@rpi.edu>
Source record: 240843

[]
I have a 1200 baud modem attached to my ST (on the normal AUX: port.)
I have a remote system that speaks SLIP and has a dialup.
I have the KA9Q software.

Can someone please tell me how I should set up KA9Q's NET.RC to
tell it that I have this setup? I don't think I have the 'attach' command
quite right, but the documentation is very frustrating (especially since
it's IBM-specific, and leans toward people who aren't doing SLIP on the
modem port.)

Any help in this matter would be me with eternal gratitude! If you're
running a similar KA9Q setup, sending me your NET.RC would make me very happy...

My NET.RC currently includes (among other things):
attach asy AUX: 0 slip sl0 4640 232 1200
route add default sl0
ip ttl 32
tcp mss 192
tcp window 960

I get it to send out the first SYN at startup, and the remote system
answers, but trying to do anything after that results in nothing being
sent to the modem...

I never experienced any problems from neoqueue, but then I stopped using it
since I use the spooler that came with my UltraDisk. However, I've noticed
problems trying to switch resolutions when NeoCntrl was installed on my
system. Plain-old lockup when going medium to low or vice versa. I haven't
reported this to Gribnif yet, but I'm fairly certain it's the culprit.

4358. Need advice/sources for making simple 68000 system

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 04:22:18 UTC
From: bwhite@oucsace.cs.ohiou.edu
Message-ID: <1398@oucsace.cs.OHIOU.EDU>
Source record: 240846
Cross-posted to: comp.sys.m68k,comp.sys.atari.st,sci.electronics

I'm in the process of designing a 68000-based controller to interface
with a small micro (Atari ST) for a peripheral. What I need is some sources
for very simple 68000 computer or controller circuits. I have worked with
8-bit processors and static RAMs, but never tried to tackle dynamics. My
specifics are:
64K of EPROM in address 000000 - 00ffff
64K of DRAM in address 010000 - 01ffff
Memory-mapped I/O in 020000 - 02ffff (not 64K worth!)
2M of DRAM in address 100000 - 11ffff
Clock speed 2MHz or 4MHz.

Essentially I need info on a memory controller chip (does not need to
perform refresh, I can do that from the code), a clock generator, and
some simple buffered I/O. I will be making extensive use of interrupts
(autovectored), probably all 7 of them.
If anyone can give me info on either 1) a source of information for this
(magazine article, book, etc) or 2) a personal schematic (or portion
thereof) which you could snailmail me (I'll pay postage), I'd be very
grateful.
Please respond E-mail as bwhite@oucsace.cs.ohiou.edu. I do not
have the time to read these newsgroups regularly.

4359. Re: Atari stock

I stand corrected. I hadn't taken into consideration the plethora
of commission deals offered by discount brokers. Rather, I had been
using a general case. However, the point is moot. CBM and Atari
have lost those small gains in subsequent trading. They are VERY
volatile and only seem to jump on very bullish days. Anyway, this
thread has gone on long enough. Future replies to email please.

Will I'm not sure about it I still think you should have a close look at the
KA9Q software if you can get it. It has to my knowledge been ported to the
ST line and should include at least sources for SLIP == Serial Line IP.

Once you have a SLIP connection to a host there should be no problem running
ftp on top of it - all the work is done below the TCP level.

I do not know of any FTP implementation designed to run directly on top of
serial lines. That would, I think, not be very portable apart from calling for
a major redesign of most ftp software.

I hope this helps a bit.

David Watters asks:
>Where on earth did you hear the Atari Games was going to market the tg porta
>and don't you think that with the tg-16 and sg-16, NEC would want to market
>themselves?

Sigh... this all came from a *Z-Rag* "newsbreak", which they've subsequently corrected to indicate that Atari Games has only signed to develop software for the NEC system. NEC will market their game under their own name...

Another factor is, superior hardware or not, other game manufacturers seem to understand the necessity of supplying new games for their systems, a fact of videogame life that seems to escape Atari Corp... the ill-fated "XE Game System" had dozens of games promised for it, but few ever materialized...

A friend is selling his Lynx, even though he knows it's far superior, and is planning on buying a Nintendo Gameboy... why...? Because in the six months or so since Atari introduced the Lynx, they've only released one or two new games for it... he's played "Shoot the Curl" and "Hacky-Sack" till he's blue, he's mastered all the levels of "Chip's Challenge" and he's bored with "Gauntlet III"... where does he go for new games for his Lynx..? Nowhere...

Sure... there are dozens of new titles promised for the Lynx by Christmas... but that doesn't help my friend... NOW...

Maybe none of this matters to Atari.. the Lynx is selling like hotcakes, to people to whom the few games that are available are all new... by the time everyone gets bored with those games, Atari may have moved on to something else...

>
> Leo.
> ----------

The fastload bit tells GEMDOS not to clear the heap. The
heap is the memory given to the program but not a part of text, data or
bss. So turning on the fastload bit will still relocate your program
AND clear your bss.
Only programs which expect a zeroed heap (assuming malloc() returnes
zeroed memory) may crash.

Just a remainder, THIS features is documented only since TOS 1.4 .

What you think was a fast load flag in TOS 1.0 isn't identical with
the officially documented one in TOS 1.4.

>c) Since most programs really need the relocation, they can't use the
>fast load flag. In this case - the most often case - GEMDOS will still
>clear all of the process' memory; much faster than in the old ROMs, but

>Pinhead will only clear all of BSS; the difference in speed you get is
>most certainly not a placebo effect (for a small program most time is
>in clearing the memory; loading it takes less).

You can set the fast load bit for programs that need relocation. Take,
for example, WORDPLUS. Again, the TOS 1.4 fast load bit has nothing to
do with the TOS 1.0/1.2 program header trick that switches off relocation
and the clearing of the BSS and stuff. The TOS 1.4 fast load bit
just prevents GEMDOS from clearing all of the available memory.
Am I wrong, Allan?

4365. Spectre: cannot print word labels on NEC printer.

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 10:01:36 UTC
From: jmg@cernvax.cern.ch
Message-ID: <1880@cernvax.UUCP>
Source record: 240857

I have the GCR, plus the printlink driver for a NEC p2200. All is fine
until I want to use Word 4 merge to create and then print a set of labels.
The labels look OK when I create them as a document, page preview looks
OK, the print setup is correct as fanfold paper with suppression of
page skipping, the printer knows it is on 12 inch paper
BUT
the bl**dy output goes wrong, and the printer loses track completely
of the page setup, starting from around the end of the first page.

This used to work last year, but then I had a previous version of Spectre,
an Epson RX80 printer with Epstart driver and probably Word 3. I have no
idea which of these has caused the problems: I suspect Printlink, but if
I contact them they will probably decline responsibility since it is not
a real Mac.

Anyone got this to work?

It is unlikely that this would do any good.
I suspect that ST World is changing due to the lack of advertisers with an interest in a serious magazine rather than any drop in the readership.

>
>I am as you may guess a little no a lot upset!!
>

Me too.. I'm glad we still have comp.sys.atari.st!

chris.

4367. Re: Problems with Spectre GCR and my floppy

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 12:14:17 UTC
From: marclaan@neabbs.UUCP
Message-ID: <384097@neabbs.UUCP>
Source record: 240875

Hi All Spectres:
The new Apple System 6.05 / Finder 6.15 don't seem to work properly
under GCR 2.65. They run ok, when you first boot with an older
System/Finder version, and then change to the new 6.05 via
Option+Ctrl+Finder-launch.
But: rebooting (for instance via Shift+Undo) ends in the graveyard-->
the crashpage of Dave Small says: Illegal Instruction Error. Same
occurs when you directly try to boot with the new system 605.
Anyone with better experiences?
(by the way: we installed 6.05 with Installer, under GCR and in Mac
Plus-configuration). We use 1040 ST, with 2.5 meg, and a Megafile 44
removable with Mac-partition (bootable).

4369. Getting terminator ST stuff.

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 13:11:14 UTC
From: cmp8157@sys.uea.ac.uk
Message-ID: <1468@sys.uea.ac.uk>
Source record: 240863

Could some kind soul please E-mail me some info on how
to get things from the terminator archives for my ST. I've
successfully retrieved things from the Lancaster PD archives
here in England, but I can't seem to get the Sun here at the
University of East Anglia, which I use for downloading, to
manage any anonymous FTP on foreign sites, specifically the
terminator site.
Another problem is that I have absolutely no idea of
the file names of things there and I don't want to try a
wildcard (assuming it accepts them) for fear of overloading
my mail file.

Extremely grateful thanks in advance,
Steve.

>
>Will the new version be posted to comp.binaries.atari.st? I would
>appreciate that!
Yes, version 1.0 will be posted to comp.binaries.atari.st within the
next two weeks (I hope).

The distribution will contain the screen previewer (showdvi), a library
program (with source) and a printer driver for various printers (NEC P6[+],
HP DeskJet[+], Epson FX ?? and Atari Laserprinter SLM804).

A few features:
showdvi and dviprint now handle any resolution,
font names could be 32 characters long,
many configuration possibilities,
....

Version 0.76 of dviprint at dsrgsun only works for the Atari Laserprinter,
please do not use it with the above printers (sorry!).

I assume this has something to do with Windows 3.0 for IBM PCs.
I really hope that IBM and Microsoft can team up and kick Apple's butt.
I despise the way that the computer society has been disillusioned into
believing that Macs are even worth buying. I think they suck! Get 'em outta
here! Come one, get 'em outta here! If Atari or Commodore can't do it, which
they obviously can't, then I'll settle for IBM.

No more "but that's unfair, people LIKE using the Mac."
How about "people like money"?

4374. Tackle Box ST and Pascal Source code...

Newsgroup: comp.sys.atari.st

Before seeing this, I had downloaded showdvi/dviprint from dsrgsun.
As you say, the HP output from dviprint doesn't work, but I tried the
Epson FX mode (using my HP's FX-80 emulator) and that one worked fine for me...

Just thought you'd like to know.

4380. Latest Picture Fomats List

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 22:25:57 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May16.222557.5838@wam.umd.edu>
Source record: 240873

John Brochu, author of the famed "PicSwitch", sent me a letter
and a disk containing modified picture format descriptions for NeoChrome,
DEGAS Elite Compressed, Spectrum 512 Compressed, GEM Bit Image, IFF,
and MacPaint formats. John also sent a description of the PackBits
compression method used in DEGAS Elite, IFF, and MacPaint formats.

Here's the new version with his corrections. Many thanks go to
John for his contributions, and also to Gerfried Klein who sent
the MacPaint description as described by by *pple, corp.

Dave Baggett
dmb@wam.umd.edu | dmb@TIS.COM

PS> The "GEM Bit Image" description in previous versions describes an
outdated version of this format which has been replaced by what
is described below. John believes that the old format was never
actually implemented, so I took the description out.

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero

```
--------
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
```

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom (i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits

hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)> *.SPC

1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

<= 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Art Director> *.ART (low resolution only)

```
16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation
-------------
32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)
-----------
32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)
-----------
32000 bytes total

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines
-------
? words header length defined in 2nd word of header

? bytes data
```

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
storing the color palette. Some programs may save the palette in separate
files, some may extend the header. For this reason, you should never
assume the header is 8 words long, always get the header length from the
2nd word of the header. Also, the line width in the 7th word is the number
of pixels in a line. Since the data is encoded in byte-wide packets, the
actual unpacked line width is always a multiple of 8, and may be 1-7 pixels
longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes to use
literally. The literal data bytes follow.

otherwise Solid run. The value of x determines
what to draw. The high bit specifies whether
the pixels are set or cleared. A 1 indicates
a byte-run using $FF, a 0 indicates a byte-run
using $00. The low 7 bits, taken as an unsigned
quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

```
x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
```

```
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
```

```
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk. This is the number of bytes that FOLLOW the 4 ID bytes
and size longword. The exception to this is the FORM chunk. The size
longword that follows the FORM ID is the size of the remainder of the file.
The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:
```

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

<MacPaint> *.MAC

1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
----
512 bytes total for header

< 51200 bytes compressed bitmap data

< 51712 bytes total

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

4381. Re: deleting programs from autofolder under dcdesktop

Newsgroup: comp.sys.atari.st
Date: 1990-05-16 22:53:12 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3312@rodan.acs.syr.edu>
Source record: 240874

Mike, Thanks very much for explaining how to delete those programs from the auto folder...Just out of curiousity, are those directions in the manual? If so, where are they? what pages, etc?
By the way, I am having no problems with DCclock, as long as I load it from the desktop...I've installed it on the desktop, so what is one more keystroke?
By the way Mike, as you can see below, I have just gotten this hard drive, so it wasn't so bad to zero a partition...I didn't have very much on it.

I would just like to say that I really LOVE this program...i.e. dcdesktop. I've been an avid fan of double click for a long time now, but this collection of programs is by and far the best. I bought dcdesktop before I had a hard drive and was learning how to use all the features when I was able to buy a hard drive. Let me tell you, having a hard drive would have been a great improvement all by itself, but having dcdesktop help navigate through everything is like having a brand new computer. I can certainly recommend this program without any reservations...it has done wonders for my ST.

--Gerry
(I have absolutely no connection with double click software other than being a satisfied user of their software.)

>(Sorry, I wasn't paying attention when this last popped up)
>
I'll post this publicly, as I'm sure there's more than one person
interested in this.

To get WordPerfect at the student price of $99, you need to find out if
your college is part of the program. Go to your computing office and
find out. If they ARE part of the program, they will have forms. Fill
it out, and send in the required proof (a copy of your ID, or a copy
of your schedule of courses). I believe WordPerfect mails them out
from their headquarters (at least mine was 2 years ago).

>
> 1) to prevent people from entering votes via news
> 2) to prevent people from entering ambiguous votes
> like "yeah" or "uh-huh"

Why can't I vote from news? I personally prefer to hit the old "r"
key and rip off a quick "NO" vote. I mean, why shouldn't I?

>for EXACTLY the reason that I didn't want stuff like this to get started.
>You can't win, I guess.

What did you expect? People don't come up with legalistic wording
just to practice typing.

>(But it sure is nice to know he's not voting "NO[space][space]" just because
>I'm a total twit!) :-)

Gee, nice to know you don't know how to reply to private mail by mail.

I would like to go on public record as protesting the entire nature of
this vote. Mr. Baggett is not qualified ethically to conduct this vote,
and the current scandal should more than disqualify this as being a
valid vote. I strongly encourage =everyone= who reads this note to

send in a "NO" vote immediately, or to send Eliot Lear a letter requesting
this vote be dishonored until a more honest vote taker can be found.

>People have been sending me NO votes with comments like "this vote doesn't
>follow the guidleines."

Your vote does not follow the guidelines, this is why people have
been sending you "NO" votes. I strongly encourage everyone reading
this message to send you a "NO" vote.

A strong, clear, unambiguous message needs to be sent out that
overly restrictive and specific voting requirements will not be
tolerated.

>Give me a break, guys. If you like the idea, vote YES. If you don't
>vote NO. But don't vote NO because you haven't been following the
>discussion and misinterpret lear's comment.

Please, whatever you do, vote "NO". This newsgroup can come up
for a vote again later. But whatever you do, end this silly
tendency towards overly restrictive and legalistic wording in
newsgroup votes.

Seriously, I am getting very tired of having to respond to
"nay@blarf.com" rather than "no@blarf.com". How many of you
have actually responded to "no" rather than "nay", and then been
very upset not to see your "NO" vote tallied?

alkman@hexagon.pkmab.se (Stefan Alkman) writes:

>I'd like to run Unix or something like that on my Atari Mega 2 ST.
>I've heard that there are something called 'minix', but i don't

A real UNIX doesn't exist for the Atari ST because this computer
lcks a paged-mmu. MINIX, in fact exists, but it is an educational
operating system written completely in the C language and therefore
a little bit slow.

If you want to use a UNIX like operating system on the ST, use OS-9/68k,
it's much more powerful and faster than MINIX is. OS-9 is a multi-
tasking, multi-user and real-time operating system.

OS-9/68000 is an advanced multi-tasking operating system specifically
designed for the Motorola 68000 range of microprocessors and has been
optimised for low cost, high performance applications on Atari ST
personal computers.

It is compact and highly efficient providing extremly high system
throughput on any size system. Professional support material is supplied
in the form of companion programming languages and development tools
which in themselves are a decisive element in unlocking the performance
potential of the 68000.

Besides, OS-9 is Software compatible with UNIX at C source code level.

Regards,
Marc Balmer

>
> [stuff deleted]

So far so good... Do you have a "start telnet" also?

Here are the steps I go through:
1. Using STalker (an excellent desk accessory communications program, I
dial the terminal server. After the CONNECT, I get the t.s.'s prompt
and I enter the command "slip". At this point, the t.s. returns an
IP address (e.g., 1.2.3.4) and goes into SLIP mode. I then prevent
STalker from stealing any line characters by typing <ALT>-K.
2. I close the STalker window, then double-click on the NET.TOS program.
3. At the prompt, I enter: IP ADDR [1.2.3.4]
(Yes, the square brackets are required)
4. I then type: telnet myhostname
or: telnet [1.2.3.135]
This produces a "SYN sent". A few seconds later, I get the prompt
from my system at work and log on...

The "magic" key is F10. Pressing F10 will give the "NET>" prompt where
you can issue other KA9Q commands like "start ftp", etc... Press <CR>
on an empty line to return to the _active_ session, or "se #" to return
to a specific session when you have more than one active.

Voila!!

Note: I ran into a problem where the NET.TOS program would crash,
especially if I ran almost any other program after bootup, but before
NET.TOS. I eventually traced this to the ST.C program; there were a
couple of memcpy(...) statements which did not have the length specified.
This was corrected by adding ",sizeof (struct iorec)" just before the
closing parenthesis and recompiling. I also took the opportunity to

reduce the size of the code by removing AX25, etc by modifying CONFIG.H

Oh, there were a number of other fixes I had to make to MAIN.C in particular
to keep the MWC compiler happy, but all in all relatively easy.

> How long do you think there WILL be an Atari Corp. Lynx if Atari Games (the
> "other" Atari company) begins marketing the NEC 16bit handheld video game
> (which is far superior to the Lynx) *with* the familiar "Atari" logo on
> it (which Atari Games has the rights to use)...?
>
Does anyone really believe this guy?? What a pile of bull. For one,
the Lynx is doing very well, and another, the portable NEC is at
least a year away. Another is why would NEC give it to Atari Games,
who doesn't have anything to do with any home machines? Atari Games
only does arcade games, and in concert with Namco.

I hope that noone believes this bull.

> videogame life that seems to escape Atari Corp... the ill-fated "XE Game
> System" had dozens of games promised for it, but few ever materialized...

Well, what games are you talking about. The XE Game Systems is a
dead issue at the moment, but what are you talking about? There
WERE a dozen games or so that were released for it. And if you got
a disk drive, there were a TON of games that were available. In
fact, there were more than enough cartridges that were available at
the time it was released. I'd suggest that you get your information
straight, rather than just speculate.

>
> A friend is selling his Lynx, even though he knows it's far superior, and
> is planning on buying a Nintendo Gameboy... why...? Because in the six
> months or so since Atari introduced the Lynx, they've only released one or

Hooray for your friend. WE do not care that your friend buy an
inferior game system. I mean, monochrome?

> Sure... there are dozens of new titles promised for the Lynx by Christmas...
> but that doesn't help my friend... NOW...

Well, if you like playing the same games all thr time, that is who
many "run and jump", "horizontal blast-'ems" do you want, anyway?
At least the Lynx games have a variety of games. Well, I'm not here
to change your mind, since it is already set. So get your gameboy,
sell your Atari stock and equipment, and unsubscribe...

4389. Some Phantom clues

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 11:28:20 UTC
From: icsu8053@caesar.cs.montana.edu
Message-ID: <1915@dali>
Source record: 240881

I was struck by the Pahntom for the second time in my life tonight. I was typing a mail message in Unix windows when it struck and I took some time to play with the Phantom before reseting.

Wierd thing #1: I never touch the backspace key in Unix windows, only delete. Doesn't the phantom usually strike when using backspace? I *was* doing a lot of delete-type-delete-type business at the time.

Wierd thing #2: After exiting Unix windows, I landed back in Gemini. Just for kicks, I thought I should try mupfel (in its window). Low and behold, it worked great and at full speed. Then, I exited mupfel and entered the Diary 1.7 desk accessory. It displayed all the classic Phantom symptoms. So, here were two windows, side by side; one with the Phantom and one without.

The only conclusion I could possibly make from this is that the Phantom resides in GEM. The mupfel shell does not use it and Diary does. This isn't much of a conclusion, but it does *seem* to defy the hardware timing theory. Although, I'm no expert of ST hardware *or* software.

My system config at the time was:

Hardware: Mega 4 ST, Megafle 30, Supra 2400
Operating System: TOS 1.4 (6-chip EPROM version)
\AUTO programs: Shadow 1.1, cache100, foldr100, {_g+plus, poolfi, maxidisk, saver.prg, shell0.prg, skull.prg, superbt, tos14fix.prg, vaccine.prg, watcher.prg
Accessories: Shadow 1.1, AlarmClock, M-Disk 4.3, Diary 1.7, MiniTerm 9.33, Gem-clipboard (from Gemini 1.1)

I hope this helps someone. I should add that this only the second time I've seen the Phantom since 1985. The other time was in Word Perfect, the first release, on my 520ST. I now use WP 15-30 hours a week and the Phantom has stayed away. Why? "Only The Phantom knows..."

4390. John Haugh's second tirade

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 12:27:52 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May17.122752.14190@wam.umd.edu>
Source record: 240880
Cross-posted to: news.groups,comp.sys.atari.st

This is the last message on the topic I will reply to, either via mail or news:

In article <18313@rpp386.cactus.org> jfh@rpp386.cactus.org (John F. Haugh II) writes:
>I did not give you permission to post private mail, and in fact I would
>like to catagorically deny having written any of what you posted.

If you hadn't really written it, you probably wouldn't be scurrying around to cover yourself right now. You have every right to deny you wrote it, even though you'll have a real hard time coming with a motive for my making up something like that, given the typical character of my postings. (Ask anyone who reads comp.sys.atari.st).

In any case, I still can't see any reason why you had to send me obscene mail in response to my call for votes.

Perhaps this should be mentioned in the newsgroup creation guidelines? Any vote containing obscenities and personal attacks should be ignored as having come from a complete psychotic? Nah, that's too "anal retentive", to use Mr. Haugh's "supposed" words.

>That's your story.

Sometimes fact IS stranger than fiction. I didn't see anything terribly controversial invovled, such that I would have to tell a story. Your note, aside from offending someone you didn't even know, pointed out that my wording was too harsh. I admitted that, and I clarified my statement.

>What did you expect? People don't come up with legalistic wording
>just to practice typing.

No, they don't. I worded it that way intentionally. I went a bit too far in my attempt to limit the number of uncountable votes; uncountable yes votes AND no votes.

>
>>(But it sure is nice to know he's not voting "NO[space][space]" just because
>>I'm a total twit!) :-)
>
>Gee, nice to know you don't know how to reply to private mail by mail.

I don't reply to people who send me obscene mail. You should take responsibility for what you write. If you want to discuss the legality of publishing private mail on the net, you may defer the discussion to misc.legal where it is more appropriate.

I might also point out (for the sake of argument) that this "reply"
to me is posted publicly. You don't know how to use mail either,
I guess.

>I would like to go on public record as protesting the entire nature of
>this vote. Mr. Baggett is not qualified ethically to conduct this vote,
>and the current scandal should more than disqualify this as being a
>valid vote.

Once again, it's your perogative to go on public record saying whatever
you like. But you know and I know that you're simply angry and want
some kind of revenge. I'm sorry about that.

Your implication that I'm unethical is completely without grounds.
Let's review this:

1) You send me a NO vote containing an obscene diatribe
2) I address the issue you raised publicly, quoting you.
3) I'm unethical.

I don't see how 1 & 2 imply 3. Maybe I'm missing something. Originally,
I was just "anal retentive", meaning (I assume) that I was being too
strict in my call for votes. OK, I _was_ too strict, and I attempted
to publicly clarify the situation.

How does that make me unethical?

The "current scandal" is entirely of your making. There is no "scandal",
except the one _you're_ currently engaged in for "allegedly" sending me
obscene hate mail.

Your call to arms is disgraceful:

...send in a "NO" vote immediately, or ... send Eliot
Lear a letter requesting this vote be dishonored until a more
honest vote taker can be found.

You may have a problem with me personally, but you aren't helping your
case be waging a smear campaign like this. I'm sure the people who
have voted YES don't appreciate your attempt to kill this new group
because of your own personal problems.

I could likewise tell everyone reading this to vote YES, just to counter
your obnoxious attack on the group, but I'm not going to do that. At
this point I'm just too disgusted to really care.

Dave Baggett

4391. Getting KA9Q

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 12:33:24 UTC
From: dinapoli@rodan.acs.syr.edu
Message-ID: <3318@rodan.acs.syr.edu>
Source record: 240882

I've seen a lot of posts about the KA9Q package, so I thought I might check it out. I ftp'd the net_st.arc archive from flash.bellcore.com to the Gould NP-1 that I run rn off of. From there I downloaded it via C-Kermit to the Sun 3/260 server here in my office. From there I used GEM-Kermit from my Mega 4 (again, in binary mode) to yank it off the Sun server (again, using C Kermit on the Sun). Once accomplished, I tried to UnArc it with ARCX.TTP. It unpacked the first few files, but crashed when in the middle of unpacking NET.RC~ (Address error). I then tried to un-arc again, picking up where I left off. The next file was NET.TOS and that crashed ARCX.TTP as well. Any suggestions? Am I using an obsolete version of ARCX (I've seen a more up to date one on Compuserve) ? Have I done the ftp from flash.bellcore.com incorrectly?

Thanks

Ron DiNapoli

4392. spice for Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 13:37:07 UTC
From: micro@imada.dk
Message-ID: <757@imada.dk>
Source record: 240885

Hello netters;

Is it possible to get Spice for Atari on a FTP site (where) - I
have just seen it in a German PD libary, so obviously there is a
PD/Shareware version...

- Klaus (micro@imada.dk)

4393. UltraScript for Linotronic ?

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 13:46:06 UTC
From: micro@imada.dk
Message-ID: <758@imada.dk>
Source record: 240886

Hello netters;

From a review of a DTP pacage called Fleet Street Pub. we
understand that the Postscript emulator UltraScript from Imagen
supports different printer drivers...
The review suggests that you would be able to get "..Postscript
Quality even from a modest 9-pin printer.".
Atari sells UltraScript as a Postscript option for their Laser,
but they (Atari Denmark) don't know about other drivers.

Now to the questions:
- Are there drivers for Linotronic printers (using the interface
from DMC).
- if not:
- is it possible to write one, eg can UltraScript support 1200
or even 2400 dpi.
- can UltraScript generate an .IMG file (20 Mbytes!) for the
page...
- Would Imagen be interested in offering the DTP world a Software
RIP for the Atari?
- Is Imagen on this network?

-Klaus (micro@imada.dk)

4394. XBRA from C

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 13:49:11 UTC
From: micro@imada.dk
Message-ID: <759@imada.dk>
Source record: 240887

I have just started to use the XBRA protocol to intercept system
vectors. I want this standard to spread in order to keep my programs
running [-keep it selfish else they don't believe you ;-)].
Ok, I know that there are problems with the XBRA protocol - It's
for assembly programmers only...
That is the reason for this posting, I have written some assembly
routines to enable C programmers to use the XBRA protocol, without a
single line of assembly. You are free to do anything ('cept selling)
with the pack, which contains :
XBRAC.S The Assembly source.
XBRAC.O Object file.
XBRAC.H Header file.
XBRADEMO.C Demo program (sic).
XBRA.TXT This text++ and your suggestions.
Doc's in the source!

There are 4 entry points:
XB_isinstal(), XB_install(), XB_remove(), XB_kill().

To illustrate how simple it is, here is an example. You want to
install a 'clock' on the system vektor at 0x400, All you have to
do is to make a 32 byte array:
char magic[32] = "XBRA_id_";

where '_id_' is your id. The rest of this array is used to hold a
small assembly routine. Install the routine on the vector :
XB_install(magic, 0x400, clock);

where 'clock' is the name of the routine. This call makes a copy of
the assembly routine into the array [-don't modify the array after
this call]. 'XB_install' returns 1 if a routine with your ID allready
was in the chain (yours was not installed). Otherwise your routine
will now be called 200 times every second!
To remove the routine again, simply make the call :
XB_remove(magic, 0x400);

this again will return 1, iff your routine was found (and now
unchained), 0 otherwise...
If you are sure your routine is in the chain and 'XB_remove'
returns 0, you can kill it with 'XB_kill' this function relayes on
the variables in the 'magic' struct (it'd better be installed or
...).

There is one minor short coming - the pack is for Borland TC only,
but you are free to modify the source to run with your favourite C
compiler.

The routines relayes on several TC specific things :
o First pointer parameters are passed in A0, A1.
o First simple parameters are passed in D0, D1, D2.
o All functions [shall] preserve D3-D7/A2-A7.

If you are interested please send me a mail. Depending on the interest I will either mail individually or what ever...

- Klaus (micro@imada.dk).

4395. CBM Stock

4397. Terminator Mail Service

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 19:01:56 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <12081@stag.math.lsa.umich.edu>
Source record: 240891

As promised, I have written a mail retrieval system for terminator.
It is in beta-test now, so I'm gonna need some beta testers. Any
volunteers?

The new service is called BART, Brode's Archive Retrieval Thang.
Send me a message and I'll give you some preliminary instructions
on using BART. (like the address to send test messages to)

If things go smoothly, then we'll install it for general usage in a
week or so.

Jon Brode -- dyer@math.lsa.umich.edu Jesse '92
Terminator Atari Archive Supervisor

4398. The Terminator Posse

Newsgroup: comp.sys.atari.st
Date: 1990-05-17 19:33:07 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <12082@stag.math.lsa.umich.edu>
Source record: 240892

After a long vacation from the archive business, I'm back on the block. But since I don't have the time I once did, I've recruited some people that are willing to help restore terminator to its former glory. Here's a short introduction to the terminator volunteer corps.

Jeff Weiner - weiner@terminator.cc.umich.edu

Jeff is doing what I used to do. He's the one responsible for getting new software, co-ordinating the indexing efforts and fielding comments/complaints. When in doubt, bother him.

John R Dunning - jrd@terminator.cc.umich.edu

John takes care of the 8-bit stuff and is responsible for a lot of the GNU software. We like him even though he spells his name wrong.

Graham Higgins - gray@terminator.cc.umich.edu

Graham is our European connection. He's helping out with the index and keeping us up to date on all those new programs coming out in Europe. He's the one responsible for moving a lot of junk out of the unindexed directory.

Susan Gross - gross@terminator.cc.umich.edu

Susan takes care of the archive on U of M's mainframe. She's helping out with the index as well.

Howard Chu - hyc@terminator.cc.umich.edu

Howard is our technical consultant and chief automation engineer. Recently, he's installed a system that archives the binaries and sources groups automatically.

Jon Brode - jon@terminator.cc.umich.edu

Last, and possibly least, myself. I am no longer be involved with the day-to-day affairs of running the archive, but I'm hanging on as executive supervisor and laison to the terminator administrator. I'm also the one to contact about problems with BART.

Special thanks to the people behind the "grass roots" indexing project and all the people who have sent us programs over the year and months.

Jon Brode -- dyer@math.lsa.umich.edu Jesse '92
Former Supreme Allied Atari Commander for the Ann Arbor Area

Come one, folks! Do you really believe that this was all a trick to get
the newsgroup passed without a proper vote? That's stretching things a bit!
I'm sure he said that the subject line had to be the same so he didn't have to
hand count hundreds of votes. What would you have hime do? Sure, cosmetic
differences in the subject line may be counted, but they may not... You can't
be sure so he wanted to make sure people understood the importance of voting
with those words rather than. "Yessiree" or "Unh uh." Why are we voting on
such trivialities. If he wanted to fake the vote, he wouldn't have to go to
such extreme means. It would be easy.

Steve

Obviously this is just my personal opinion, but I'm amazed at how many people
are posting stuff liek this. Freud had a name for this condition.

4403. New versions of click.prg, beep.prg, and play.prg available

Newsgroup: comp.sys.atari.st
Date: 1990-05-18 02:22:50 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May18.022250.22576@wam.umd.edu>
Source record: 240897

The latest releases of these programs are available at terminator (35.1.33.8)

The drive light bug has been fixed in all three. Additionally, all three programs can be made to play sounds through a Hippo/Navarone digitizer instead of the monitor speaker. (Try putting your keyclick through a stereo system: POCK POCK POCK ...)

Beep and Click no longer use bits in CONTERM since this conflicts with other programs. Now they can be configured to use any location in memory for the on/off flag. They default to using location 768 decimal, which is currently an unused interrupt vector slot.

In any case, you can move the flag to wherever you want by putting the value in the .inf file (see the docs for more info). I think this will pretty much guarantee upward compatibility.

QD Play now has an option -q which prevents it from printing the little blurb.

Relevant files:

Name: Beep, version 1.1
File: atari/music/samples/beep.arc

Name: Digital Keyclick, version 1.3
File: atari/music/samples/click.arc

Name: QD Play, version 1.25
File: atari/music/samples/play.arc

Digivec has been shelved temporarily while I figure out more reliable ways to accomplish the same tricks, and add the ability to trigger sounds with AES and VDI events (like windows opening, etc.) (Thanks to Mario Dalessio for the idea.)

Please report any problems so I can fix things promptly. (Problems? Nah, there won't be problems.... ha!)

Thanks all,

Dave Baggett
dmb@wam.umd.edu

PS> These files should show up in comp.binaries.atari.st in a few weeks, since I'll be mailing them momentarily...

I don't really much care about whether comp.sys.atari.st is one newsgroup
or two. I can't imagine why it's worth arguing about, much less imagine
sending mail laced with obscenities, unless I felt some need to
demonstrate that I knew how to spell "anal."

If my kids got into an argument about whether to stack blocks into two
piles instead of one, I'd be shocked. They have better sense and far more
maturity.

(quoting David again...)

>>Give me a break, guys. If you like the idea, vote YES. If you don't
>>vote NO. But don't vote NO because you haven't been following the
>>discussion and misinterpret lear's comment.

Either Eliot made a mistake or there was a mixup during his vacation.
There was a call for discussion, and it was posted to the network.
The header of the call for discussion follows. Note the sender and
approved fields.

|Message-ID: <1990Apr13.225146.7988@wam.umd.edu>
|Date: 22 Apr 90 22:51:46 GMT
|Sender: lear@turbo.bio.net
|Reply-To: dmb@wam.umd.edu (David M. Baggett)

|Followup-To: news.groups
|Organization: University of Maryland at College Park
|Lines: 70
|Approved: lear@turbo.bio.net
|
|This is the first call for discussion regarding the creation of a new
|newsgroup comp.sys.atari.st.tech. The discussion period will end
|on Monday, April 30, 1990. (Total discussion time will be 18 days.)

The voting guidelines that David posted were clear and simple.

After viewing this round of scientific aquariumism, plus the recent performance of the junior stock analyst debate team, the Lynx videogame discussion and other off-topic noise, I've decided to send a YES vote on the establishment of comp.sys.atari.st.tech. I think I can figure out how to do so.

>
>Well, if you like playing the same games all thr time, that is who
>many "run and jump", "horizontal blast-'ems" do you want, anyway?

You're kidding, right? The Gameboy would _love_ to have run and jump,
blast-em type games. With that pitiful excuse for a screen, you're lucky if you
can still see your character in a scrolling field, or the scrolling field
itself (see SUPER MARIO LAND for an example).

As a matter of fact, I feel that the Gameboy is oversaturated with puzzle
titles more than anything else. Now, since there is no sudden surge of interest
in puzzle games, I am forced to conclude that this is happening only because
that's ALL the Gameboy is good for.

Heck, let the Nintendo zombies play with their little boy games. I'm just
itchin' to get VINDICATORS, RAMPAGE DELUXE, ROADBLASTERS, and TOURNAMENT
CYBERBALL (to name but a few) on my Lynx. In the meantime, there's BLUE
LIGHTNING for me to play on -- now _there's_ a game with long-term appeal.

--R.J.
B-)

P.S. Better move this to rec.games.video, this is not very ST-oriented,
no matter how you slice it.

P.P.S. Anybody seen Atari's fold-out ad for the Lynx in the June issue of
GAMEPRO? Who knows, if they can keep this up and sell lots of Lynxes, that
can have benefits for the computer line as well... (It's also a neat ad)

4406. Omti 5200 Help Request

Newsgroup: comp.sys.atari.st
Date: 1990-05-18 04:54:10 UTC
From: os9paul@gkcl.ists.ca
Message-ID: <8283@ists.ists.ca>
Source record: 240769

A friend has purchased a used Omti 5200 SCSI controller that he hopes to use on his Atari. The problem is that we have no documentation for the board. If you have any information about which jumpers relate to which functions, it would be appreciated. Or if you are using this controller, how are your jumpers set? In particular W0, W1, W3, W4, W5, W6, W7, W8, W14, and W15 setting are needed. (The other 'W' locations on the board do not have staking pins or jumpers at the moment. Should these all be open when used with the ST?)

Does anyone know an address or phone number for Omti or where the manual for this board may be obtained? As you may have guessed, we're getting rather desperate/frustrated here. Any assistance would be greatly appreciated. Thanks in advance!

From: suhonen@tukki.jyu.fi
Message-ID: <1990May18.050511.20677@tukki.jyu.fi>
Source record: 240900

Hi! (again)

Is there any way to make a _program_ that changes drive and/or directory
in a way that when the program exits, a shell or desktop would be
in that directory???

I'm writing program similar to Peter Nortons NCD for MS-DOS-machines,
it works in MS-DOS (or actually part of it), and with some #ifdef's it
should work in ST, but when the program exits...

Where does TOS (or GEM) keep current directory?? How does it know
which directory to show in desktop window??

4408. TeX shells

Newsgroup: comp.sys.atari.st
Date: 1990-05-18 07:37:14 UTC
From: mcli@joker
Message-ID: <7472@ur-cc.UUCP>
Source record: 240752

Hello everyone,

I recently setup TeX on my system and have encountered some problems.
My system is a mono 1040ST with an ICD 40 Meg Hard drive. I have my TeX
files on partition f:. I can run TeX, LaTeX, and showdvi using the texshell
written by Greg Lindahl. However, somehow, LaTeX will not look into
\tex\inputs for the .sty files. Hence, I have to resort to typing:
\tex\inputs\article.sty and \tex\inputs\art10.sty every time I run a
file through LaTeX.

Is there a better shell available where you can specify the paths to
your .sty files?

Thanks for your help.

Mark Newton-John makes a lot of "Atari Cheerleader" comments about the Lynx handheld videogame system...

>Well, what games are you talking about. The XE Game Systems is a
>dead issue at the moment, but what are you talking about? There
>WERE a dozen games or so that were released for it. And if you got
>a disk drive, there were a TON of games that were available. In
>fact, there were more than enough cartridges that were available at
>the time it was released. I'd suggest that you get your information
>straight, rather than just speculate.

Yes, the XE-Game System is a dead issue... just like so many other Atari products that received their own "ballyhoo" from Atari Corp, then had NO support in the long run...

The list of games promised for the XEGS was long... did you ever attend a CIS (Consumers' Electronics Show) and see the lists of games Atari claimed would be released "RSN" for their systems..? Did you ever wait, and wait, and wait for those games to be delivered..? They finally did ship "Airball" and "Dark Chambers", and, I believe, the XE version of "Desert Falcon", but ANY "game system" is going to need FAR more support than that...

(The disk drive option is a "non-issue" since Atari never did publicize the availability of a disk drive for the XEGS, invalidating the argument that the were TONs of games available.. OLD games at that...)

>Well, if you like playing the same games all thr time, that is who
>many "run and jump", "horizontal blast-'ems" do you want, anyway?
>At least the Lynx games have a variety of games.

Yes.. the 5 or 6 available Lynx games are different... but how long do you expect anyone to keep on playing the SAME games over and over..? Every time I look at the GameBoy carts in the local store, I see new and different games the local stores don't even CARRY Lynx games...

> Well, I'm not here
>to change your mind, since it is already set. So get your gameboy,
>sell your Atari stock and equipment, and unsubscribe...

So why are you here...? To keep on chanting the same Atari Cheerleader "rah rah's"...? No matter how unfounded they are..?

I don't plan on buying EITHER a Gameboy OR a Lynx... and I *like* my ST.. but I don't make excuses for the company that made it either...

From: cstxqdl@warwick.ac.uk
Message-ID: <545@lily.warwick.ac.uk>
Source record: 240761

I recently tried out an interesting little PD proggy called STSWITCH that splits the ST into two virtual machines which can be toggled between. Not exactly multi-tasking, but it is a pretty good idea, and I could use something like that. The problem with STSWITCH is that it is not overly robust, although the docs say this and that it was only written for a laugh.
What I want to know is : Does anyone have/know of any other such proggies which are more reliable, or of an upgraded version (I got mine from Lancaster PD). Maybe even the author is out there and can shed some light on the subject???
Answers via the net or on the back of a postcard to:

cstxqdl@uk.ac.warwick.cu

>If you want to use a UNIX like operating system on the ST, use OS-9/68k,
>it's much more powerful and faster than MINIX is. OS-9 is a multi-
>tasking, multi-user and real-time operating system.

I wonder how this OS-9 stuff compares with IDRIS .

IDRIS has been available for the ST for several years.
It was first developed in Whitesmith c for the IBMPC, and
was ported to the ST by Computer Tools International.

In 1985, UNIX WORLD magazine reportedly praised the IDRIS system for
its ability to run on hardware with no memory management unit (MMU).
I believe that IDRIS provides a HYBRID scheduler that controls its
its multitasking. (*)

I would be intererested to hear from any users about their experience
with IDRIS. I would be more interested to hear comparisons between
IDRIS and OS/9. It is my impression that IDRIS was (at one time) priced
lower than OS/9.

Lee Dickey

4416. Switching text mode font to 6x6 ????

Newsgroup: comp.sys.atari.st
Date: 1990-05-18 13:54:32 UTC
From: ant@mks.com
Message-ID: <1990May18.135432.20359@mks.com>
Source record: 240758

```
GOAL:
Last night I tried to play with LineA -ve variables and setting the
text mode font to 6x6 so that all Bconout to the console would be in
this new font. I could then have more rows and cols on the screen for smart
applications. But I think I found a design problem with the BIOS.

METHOD:
;***
;*** font6x6.s Set System Font to 6x6
;***
;
; Files: numacros.s font6x6.s
; Assemble: mac -p font6x6.s

.include numacros

first_ade = 36
last_ade = 38
offset_table = 68
data_table = 76
form_width = 80
form_height = 82

.text
A_init
;0(a0) = 6x6, 4(a1) 8x8, 8(a1) = GDOS font list
move.l (a1), a1
move.l data_table(a1), V_FNT_AD(a0)
move.l offset_table(a1), V_OFF_AD(a0)
move.w first_ade(a1), V_FNT_ST(a0)
move.w last_ade(a1), V_FNT_ND(a0)
move.w form_width(a1), V_FNT_WD(a0)
move.w form_height(a1), V_CEL_HT(a0)
Pterm0

.end

NOTES:
By changing the line 'move.l (a1),a1' ---> 'move.l 4(a1), a1' I could revert
back to my original 8x8 font.

I have neglected to set V_CEL_MX, V_CEL_MY, and V_CEL_WR at this point in time
since these seem only to control the number of rows, cols, and vertical
cell displacement.

PROBLEM:
I run the program and I end up with a 6 high x 8 wide font. The BIOS or who
```

ever is doing console output for Beckmeyer's Micro CSH accepts everything
but insists that the font cell width is 8 pixels so I end up with the
right character but also the first 2 columns of the next one from the font data
table. I looked through the LineA variables and I could not find anything that
looked like V_CEL_WD (alpha cell width). Nor does the system output routine
compute the cell/character width in the current font size. It would seem that
the cell width is fixed at 8 pixels.

QUESTIONS:
1) Can I change the system alpha font to 6x6?
2) Am I forgeting to set something in the LineA variables?
3) Is there another *simple* *low-level* way to switch the system alpha
font so as to be transparent to any user programs (ie. shells, editors).

Future thanx for your help, and my your camel not spit into the wind :)

>send in a "NO" vote immediately, or to send Eliot Lear a letter requesting
>this vote be dishonored until a more honest vote taker can be found.

And by this you transform a voting for a new group to a personal
war. Why?

If you want to know I voted "YES", not because of this posting (actually
already a couple of days ago), but because I think it's a good idea to
split comp.sys.atari.st into several smaller parts. Everybody is
probably not interested in reading about "How do I to kill a virus" or
"The Phantom Typist".

[Maybe a new group news.groups.vote would be a good idea? All votes
could then be posted there?]

DISCLAIMER: This is _my_ opinion, and you can't change that. Please
don't flame.

Possibel idea on:

How to get a top non-scroll zone

In browsing SALAD last night I noticed a -ve variable V_CUR_OF (-30) that is the "byte offset from screen base to top of first cell".

Could not this variable offset into the screen where the first (scrolling) screen line would be; ie. a new (0,0) orgin. Then top area from 0 to offset could be used as a status area.

QUESTION: What is this variable actually meant to do??

>I've heard that there are something called 'minix', but i don't
>now anything about it. So if someone who has tried something like
>that or somthing else who is like Unix, I'd like to hear from YOU!

Yes, Minix/ST is now out in its version 1.5.10. It is now compatible in most parts to its IBM pendent. It includes the source of a UNIX like operating system and has System 7 compatible system calls as well as a POSIX library. The standard compiler, which is used to compile it, has ANSI abilities. This is due to the fact that a real ANSI PC version won't fit into the magic 64KB.

Well, it made itself to become a very good OS in its V1.5.X versions, which are not official, but from a nice man called Frans Meulenbroeks. Therefore you'll not be able to buy it. You only can get V1.1 for about ECU 130,- and then get any upgrades from someone you might find in comp.os.minix, where you'll find further upgrades, too. Otherwise you'll might find anotherone in Sverige there, because everybody is allowed to make three copies for friends for educational purposes.

You can get the famous GNU full ANSI C compiler, too. Some 100 standard unix tools are included, e.g. sed, awk, yacc, vi-clones, etc. I like it very much.

Keep in mind that it is for educational purposes, and therefore in a very modular design, with message passing between the relevant parts of the system. Therefore it is not very speedy, but it satisfies.

Source record: 240763
Cross-posted to: news.groups,comp.sys.atari.st

In article <1990May17.122752.14190@wam.umd.edu> dmb@wam.umd.edu (David M. Baggett) writes:
>This is the last message on the topic I will reply to, either via mail or news:

Sure, why fight a losing battle? I've already received quite a few letters
from people pointing out that they were confused by the voting rules which
you placed on your newsgroup and have serious doubts if their votes will
be counted at all.

I strongly encourage those people, and anyone else who has concerns about
overly restrictive wording in "Calls for Votes" to formally, clearly, and
unambiguously protest the growing trend for overly restrictive terms for
votes.

>Your implication that I'm unethical is completely without grounds.
>Let's review this:

[stuff moved around some ...]

>I don't see how 1 & 2 imply 3. Maybe I'm missing something. Originally,
>I was just "anal retentive", meaning (I assume) that I was being too
>strict in my call for votes. OK, I _was_ too strict, and I attempted
>to publicly clarify the situation.

1) and 2) weren't intended to imply 3). But let's review them for
a moment -

> 1) You send me a NO vote containing an obscene diatribe
> 2) I address the issue you raised publicly, quoting you.

You posted private mail, which I have gone on record as having both
not written and not given you permission to post. You have now
continued your public campaign, hoping to steer the attention away
from your legalistic guidelines and towards the words "anal-retentive
asshole", which you consider to be an obscene diatribe.

> 3) I'm unethical.

Perhaps 1), 2), and the fact that you violated both Federal law and
good net.behavior in posting mail allegedly written by me combines
to make you unethical, since you don't practice ethical behavior as
defined by the net. That's the meaning of unethical - not being
ethical. To be ethical one would have to practice ethical behavior,
something which you have proven you do not do by your violation of
both the law and accepted behavior.

>I could likewise tell everyone reading this to vote YES, just to counter
>your obnoxious attack on the group, but I'm not going to do that. At

>this point I'm just too disgusted to really care.

Again, there has been no obnoxious attack on this group, only on your being its vote taker. I would also encourage everyone who is going to vote against this group to copy me on the "NO " vote to insure that our dear Mr. Baggett does not lie or find other legalistic means for ignoring your "NO " vote.

I would also like to point out that your clever changing of the Subject: and Followup-To: lines has not gone unnoticed. Since this issue remains of interest to persons concerned with the legitimacy of this vote, and the potential for scandal, I have changed the subject line away from the clearly personal attack which you are trying to wage against me, and redirected this back to where it rightly belongs.

Furthermore, I would like to encourage another comp.sys.atari.st reader to step forward and take over the responsibilities for holding this vote, since I believe that is the only way a sure and certain scandal can be averted. Since I can't remember whether Peter da Silva is an Atari or Amiga user, I won't try to enlist his efforts, but I do hope that someone who is trustworthy will become involved so that this vote can proceed without further incident.

Message-ID: <72693@srcsip.UUCP>
Source record: 240760
Cross-posted to: comp.sys.atari.st,comp.sys.amiga,comp.sys.mac

In his article, Chad (no last name posted - I can see why) states -

>Funny... I've worked with *every* model of Mac...
>
>What in the hell is a Mac I?

Well Chad, the "Mac I" is how a large number of people refer to the outdated Mac 512s, SEs, etc which are all packaged in the same box that the original 512 came in - Thus the 1 reference. See Chad, the reason Apple came up with the Mac "II" (That means 2 in Roman numerals) was because they also considered the old box style machines to be versions of the Mac I.

Now if this is confusing, let me give another example - The R.S. TRS-80 Color Computer never had a "I" either, but all dealers refer to it as "1" now that there has been a 2 and a 3.

No dealer would call anything they make the "__________ 1" if it was the first model. But, once they come up with a new and improved version, called the 2, and subsequently the 3, 4, ... the original is refered to as the "one".

>Seems rather simple - Funny... I've worked with *every* model of Mac...

Yep, seems quite funny, actually hilarious, that you could not figure such a simple concept out.

And by the way, I certainly wasn't bragging about my "experience" by mentioning the PCs I have owned - Only a fool would consider mentioning owning some of those machines as bragging - but rather that each of those machines was far inferior to the Amiga and thus I called it a "real machine". If I wanted to brag, mentioning mainframes, superminis, etc would make more sense. Nope, just puffing the Amiga - but then I should not have figured you would understand that comment either.

>
>In other words, if you're going to brag about how much computer experience
>you have, *please* try to get your story straight...
>
>
>Or you'll never sell that swampland.

Peter Kovach

I've owned IBM XTs, ATs, Color computers I, II, III, TI, Exidy Sorcerer, Pet, TRS-80 Mod I, Elf, and others, I've worked//with Mac I and IIs, but the only real machine is the ---- //

>discussion and other off-topic noise, I've decided to send a YES vote on
>the establishment of comp.sys.atari.st.tech. I think I can figure out how
>to do so.

Yes, but if you should change your mind and decide to vote
"NO", remember the two spaces. And even if you should decide
to vote "YES", as is your right, make absolutely certain that
you use the exact same Subject: line which he included in his
initial call. Otherwise, according to his call for votes,
your "YES" vote is invalid and he may not count it.

>I'm writing program similar to Peter Nortons NCD for MS-DOS-machines,
>it works in MS-DOS (or actually part of it), and with some #ifdef's it
>should work in ST, but when the program exits...

This might sound easy, and under MS-DOESNT, it is, however TOS is a little different... On MS-DOS, you have a current working directory on each drive and a current drive which is global to the whole system. Under TOS, you have a per-process current directory and current drive. When a new process begins, it inherits its current directory/drive stuff from its parent and can change things for itself and any subsequent children, but not for its parent. When the child process exits, the parent process still has the same working directory and drive that it had when it spawned the child.

I suspect that there is some dangerous hack which only works under one version or another of TOS to do this, but I wouldn't recommend using whatever it is. I may be wrong, and I suspect that Atari will say so if I am, but I've been playing in the guts of TOS for a very long time and think I know what I'm about here.

This is the most paranoid bit of nonsense I have read since The Book
of the Subgenius. Dave has clearly pointed out that the number of
spaces after "NO" does not matter. What's the complaint here? You
seem to be unwilling to give up your INCORRECT INTERPRETATION of his
posting. If you're so trustworthy and fair, why don't YOU offer to
run the vote, and count 4 million votes with "My vote is: nyeah" or
"I think it's kind of a stupid idea but in the long run it may be
better so I think so but maybe not" in the header?

Are you for real or what?

By the way, IMHO Dave Bagget is trustworthy, or else I would not run
software written by him on my machine. I have several programs
written by him. What have YOU, John F. Haugh II, contributed to the
comp.sys.atari.st community, besides a decrease in the signal to noise

ratio?

4427. Ordering Sozobon C via ordinary mail

Newsgroup: comp.sys.atari.st
Date: 1990-05-18 19:56:13 UTC
From: mj@myrias.com
Message-ID: <72p9r6w3@myrias.com>
Source record: 240768

This posting is on behalf of Sozobon. Please send all inquires
to Tony Andrews. I know as much as you will do after you will read
an enclosed message.

Michal
mj@myrias.com

>>>>>>>>>>>>>>>>>>>> cut here >>>>>>>>>>>>>>>>>>>

Several people have been asking where they can get various parts
of the Sozobon compiler and associated tools. While we encourage
distribution through various non-commercial and commercial bulletin
boards, we cannot control which versions end up where. In particular,
few, if any, have added the recent bug fixes and supply fixed versions of
1.2 hcc and top.

If you are having problems finding the latest release of Sozobon C,
you can always order the full release floppies directly from us.
Send $10 US ($12 from Overseas) made out to 'Tony Andrews' to this address:
(This is a new address as Tony has moved recently)

Tony Andrews
4704 Berkshire Court
Boulder, Colorado USA
80301

Please specify single or double sided floppies (double sided is the default).

Currently, you will get all of the following:

Sozobon C compiler release 1.0
- 'cc' front end for the compiler
- 'hcc' the compiler itself
- 'top' the optimizer
- 'jas' the assembler
- 'ld' the loader
- 'make', 'ar', 'nm' similar to the UN*X tools

Sozobon C compiler release 1.2 update
- newer 'hcc' with all the latest bug fixes
- newer 'top' with all the latest bug fixes

Libraries from various other contributers
- 'dLibs' stdio library version 1.2 (Dale Schumacher)
- an improved 'fplib' (David Brooks)
- AES and VDI bindings 'gemfast' versions 1.2 and 1.3
(Ian Lepore)

Other tools
- 'stevie' a clone of the vi editor, version 3.45
- 'szadb' a clone of the adb debugger (Don Dugger)
- 'sc_desk' a version of 'cc' for use under GEM

As always, you get the source for all of the above. There is no copy protection and no restrictive license; please share with others.
You will get 2 DS or 3 SS disks. Everything is packed with 'lharc' from Haruyasu Yoshizaki (also included) to save space.

The Pexec() function lets you create another process and execute it.
The format of the call is:Pexec(code,path,cmd,x)

I managed to use this function with code=0 (Load and go) and x=0L
(Use a copy of the calling process environment).

Can somebody describe the other values that code and x accept.I would
be particulary interested in loading a program and execute it when I want.

Please, email your answers to: bisson@csogat.enet.dec.com

Thank You,

Pierre-Yves.

No, each program seems to have its own current directory, so changing the child's will not change the parent's.
>
> Where does TOS (or GEM) keep current directory?? How does it know
> which directory to show in desktop window??
>

Don't rely on any undocumented variables (like where TOS keeps a program's current directory) because they're almost certainly different in different versions of TOS, and with all the different versions (TOS 1.0, 1.2, 1.4, 1.6, TURBODOS, and maybe someday TOS/030) your program will end up not working on a lot of machines.

>Are there any networking products for this machine?

Yup. There are several about- From Germany there is "Pam's Net", which supports thick and thin ethernet, servers etc. (Get hold of a copy of the German magazine "ST Computer"). There was a british thing called "9-Tiles" which was a LAN system that could support ST, PC, Mac etc all at once, but I have not seen it for a while.
Hope this is of some help,

4434. Atari hard disk controller

Newsgroup: comp.sys.atari.st
Date: 1990-05-19 02:08:03 UTC
From: stata@hplabsb.HP.COM
Message-ID: <5735@hplabsb.HP.COM>
Source record: 240775
Cross-posted to: comp.os.minix,comp.sys.atari.st

I'm interested in using Minix-ST to experiment with optimizing
cylinder placement on a hard disk.

I want to modify the Minix-ST hard disk controller (the one that
comes w/ the standard PH 1.1 distribution). I've looked at the
file stwini.c, and have made the following assumptions about the
mapping of the sector numbers that go into the routine "do_xfer" and
the physical placement of the sectors on the disk (notes: hi_spt =
sectors per track, hi_dhc = tracks per cylinder):

1. Sectors numbered "0" thru "hi_spt - 1" are all on the
same track. Sectors numbered "hi_spt" to "2*hi_spt-1" are
likewise on the same track and are on the same cylinder
as sector "0".

2. In general, sectors numbered "i" to "i+hi_spt-1" are on
the same track for i = multiples of hi_spt, and sectors
numbered "i" to "i+hi_spt*hi_dhc-1" are on the same cylinder
for i = multiples of (hi_spt*hi_dhc).

3. The cylinder holding sector "0" is the outermost cylinder.
The cylinder holding sector "hi_spt*hi_dhc" (given that (2) is
correct) is the 2nd to outermost cylinder. Etc.

4. The controller does interleaving: sectors i and i+1, if
they are on the same track, will be interleaved appropriately.

I'm assumting that the hard disk controller automatically takes care of
seeking: you give it a starting sector and a byte count and it will
automatically go to the right place and start reading as many sectors
as needed.

Are these assumptions correct? Does the controller automatically
swap bad tracks with spare tracks? What's the format of the
bad sector table?

Regards,
Raymie Stata

Source record: 240777

Howdy everybody,

Just thought I'd let you know about a few changes at terminator.

1) All of our sounds have been moved from the music directory to their own directory called 'sound'. The players that accompany them also have been moved. They are in the 'sound/players' directory.

2) A directory called 'announce' has been added. This is designed for articles concerning upcoming atari events. I hope this will complement the postings in c.s.a.st. If you have any events that you would like to be posted here, please mail me directly.

3) A directory called 'newitems' has also been added. This should satisfy all of you who would comb through the new directory previously. Each new item will be entered there for about two weeks.

If any one has any questions concerning these changes, has material for announce or has any submissions, please contact me at weiner@terminator.cc.umich.edu
Thanks and have a swell day,
Jmw

4437. 11 Sector per track formatter...

Newsgroup: comp.sys.atari.st
Date: 1990-05-19 05:19:53 UTC
From: es2a+@andrew.cmu.edu
Message-ID: <0aJBRtu00UgyIYXcNU@andrew.cmu.edu>
Source record: 240784

I am trying to write an 11 sector per track formatter, thinking that it should be straightforward. Not so.

I have made the following calls:

```
... for(track=0;track<MAXTRACKS;track++)
Flopfmt(buf, intbuf, device, sectors, track, side, interleave, magic, pattern);
...
Protobt(buff, serial, type, flag);
[then modify buff to conform to the real #of sect/track, tot. sectors on disk,
etc.]
Flopwr(buff, filler, device, 1, 0, 0, 1);
```

This seems to work fine for sectors/track = 8,9,10, but dies for >10.

I have formatted 11 sector/track disks using my B drive using another program, so I know the drive can handle 11 sectors/track.

My guess is that Flopfmt just can't handle 11s/t, and I'll have to access the Western Digital chip directly. Does anyone have any pointers on this? I have the interleave parameter in Flopfmt set to 1. Should it be otherwise?

I know, I know, I should become a registered developer to find the answers, right? :-)

Thanks in advance,
Eric Stuyvesant

Whether you like it or not, John is correct and you are completely in the wrong. You DO NOT post e-mail without permission. Oh, you missed that minor bit when you read through the net documents? (You did read them, didn't you. Of course, you did - they just don't apply to you, right?)

I don't happen to agree with John's point about the vote. But he's a hell of a lot more correct than you are about what you do with private mail! Try reading what is expected behavior. Typing ***FLAME ON*** when you're going to go against long established guidelines demonstrates very little except that your arguments are probably worthless and you don't know enough about the net to contribute. Just blather.

>His efforts at making "NO" votes harder to have counted than
>"YES" votes makes the call for votes invalid. This is very

If indeed "grep 'NO' ... " is used to find no-votes, it is NO HARDER to vote
NO than to vote YES because grep doesn't give a damn about what precedes and
what follows a given pattern unless ordered to do so.

So if "grep 'NO'" is used you can send in stuff like
"NO to ..."
"my NOVOTE on ..."
"I'm voting _NO_ because ..."
etc. etc.
You could even vote NO by mistake if you send in a mail to the given address
saying
"Please send me your nifty SNOBOL interpreter" :-)

I don't see anything restrictive about that. Always presuming a correct
grep usage. So cool it.

Martin

4440. LaserJet III

Newsgroup: comp.sys.atari.st
Date: 1990-05-19 13:38:48 UTC
From: roddy@sbil.uucp
Message-ID: <1990May19.133848.9259@sbil.uucp>
Source record: 240782

Has anyone out there tried using an HP LaserJet III with an atari ST?

I exitedly opened up the printer box, plugged it all together and...
nothing happens. The Atari sees that something is on the printer parallel
port, so appears to send the data, but the LaserJet never seems to
receive any of it (nothing in its buffers). Could this be lack of
Ooomph in the Atari's power supply? The printer passes all of its
self tests, and the ST parallel port used to work with my old printer.

I used to have an HP DeskJet+, where there was the problem of the printer
not working if it was off when the ST was powered up, but several power
cycle tests proved the problem is not the same. Could be a duff parallel
port on the printer, but I doubt it. I will try the serial port tonight,
and try to get a different computer on the parallel port as a further test,
but I have an awful feeling that the Atari is going to let me down again...

Any pointers (esp. from all the HP.COM guys I know are out there!)

Roddy Manzie, London

> Different strokes for different folks, ok?

I have gotten numerous email requests to continue posting stock information, discontinue doing it, and some that would like me to walk into 5th Avenue traffic. :-)

The fact of the matter is that this information does provide some insight as to what the financial markets think about the strength of the companies involved. If our pet companies are doing well and instill confidence in the markets, the price goes up and we get newer/better products. If the value goes down, our companies are seen as weakening. They will have a harder time getting financing and we will not be getting new/improved toys to play with. What does any of this have to do with the ST? Absolutely NOTHING! (But neither do posts about the LYNX, the Portfolio and for sale postings) The do, however, act as a barometer for the health of the companies involved and they may help you decide whether to sink $500 into that new whizbang accelerator gadget thingy or wait for an updated machine or switch companies altogether. I don't think these newsgroups were meant to be used to talk about vectors, interrupts, and C code all the time, but to talk about a variety of interests that we, as computer owners, may have interest in. Also, I have gotten MANY more letters saying they appreciated hearing stock news occasionally than letters indicating otherwise. SO I will continue to do so. If you don't want to see them (and some of you obviously do not) please feel free to put the word "stock" in your kill file. I will always include this word in the subject header. This should satisfy those of you who feel qualified to be net.police who grumble about "what type of message should go where."

Have a good one,

Chris

I am still looking for info on hooking up Atari STs to an ethernet network.

Are there any networking products for this machine?

C'mon. Someone must know.

Thanks.

I don't know of anyway to hook it directly to an ethernet, but
you could hook it to a machine on an ethernet through the RS232 port.
This would give you access to anything on the network that machine has
access to.

4444. Help with copy protected games

Newsgroup: comp.sys.atari.st
Date: 1990-05-19 18:43:45 UTC
From: rjd@cs.brown.edu
Message-ID: <40322@brunix.UUCP>
Source record: 240786

I have a couple of games that I enjoy: Dungeon Master and
Dark Castle. Unfortunately, I hardly ever play them, because I
have to load them at disk drive speeds. (The programs are hideously
compressed, plus they have the copy protection schema decoding
to deal with.) Every inital game load takes minutes...which seems
like hours when you are waiting. (When I play games, I usually only
have a about 20 minute or a half an hour to spare...)

Can someone recommend a disk copier that will allow me to
install these games on my hard disk? Or, instead, does anyone
know if the companies that make these games will sell me a
hard disk installable version?

Thanks in advance.

4445. KA9Q & SLIP: how I got it to work.

Newsgroup: comp.sys.atari.st
Date: 1990-05-19 19:29:06 UTC
From: kibo@pawl2.pawl.rpi.edu
Message-ID: <K_%5-@rpi.edu>
Source record: 240788

[]
In last week's installment, Kibo had downloaded KA9Q from
terminator.cc.umich.edu and couldn't make it do SLIP over his modem.

He was frustrated and nobody could help him so he decided to go
browsing for ofther software to play with. He FTPed to flash.bellcore.com
and, lo and behold, he found file net_st.arc which contained a different
version of NET.TOS. The bellcore version was two years newer, fifty
percent bigger, and wasn't compiled from damaged source files. Kibo installed
it with the same setup that he couldn't make work with the terminator
version, and it worked.

So anyway, if you want KA9Q, I suggest checking which version
of NET.TOS is included before you download. The most recent one I've
seen was the one from flash.bellcore.com. It works very well for my
modem SLIP use (it does tend to lock up if you open too many sessions
and thus fill up memory, but that's far far better than not working at all.)

Thus we leave Kibo, with FTP and Telnet servers happily bouncing
packets around the net, until the next installment of: Kibo Gets Networked!

>I know, I know, I should become a registered developer to find the answers,
>right? :-)

I've written a program to do this, but I don't use it. The 11 sector format is too unreliable. However, if you want the info without shelling out the bucks for the developer's kit, you might try the Abacus ST books. I used their volume 13, ST Disk Drives: Inside & Out to get my program started. It's helpful to have some other references handy, though, as I found some errors in the Abacus descriptions. (As well as the all-too-common ambiguities in the descriptions. That's the real reason to have multiple sets of docs. I have the Abacus ST Internals and GEM Programmers Reference as well, also have The Concise Atari ST 68000 Programmer's Reference Guide, the dev kit, the MWC manual, a couple Compute! books, etc., and I tend to use two or three of 'em in one sitting. With an ST, you can NEVER have Too Much documentation. (More's the pity, eh?)

I saw a neat hack somebody uploaded to GEnie called Flash-Format, which you may also want to look at. Apparently if you pass an interleave of 11 to Flopfmt, it writes 10 and 1/2 sectors per track. If you treat the disk as a 9 sector per track disk, you get better speed than with Twister format. When the head is seeking from one track to the next, sector 10 is passing by. When the head reaches the next track, it reads the header for sector 11, which will have a

nonexistent data field/CRC. The error will cause the read to terminate with
an interrupt, and tell TOS that it's on the right track, just in time for
sector 1 to be read. I was pretty impressed, though it's unfortunate that you
can't get this high speed performance and use 10 data sectors per track.

Hm, Dark Castle ran just fine off my hard drive. But I got pretty
tired of it, I wiped it out a long time ago.

I know what you mean about Dungeon Master though. As far as I know,
FTL has no plans for releasing a hard drive installable version of it.
I'd suggest you order SwitchBack from Alpha Systems. You'll need at
least 2 meg of RAM to get any use out of it with Dungeon Master, but
once you've got it set up you can save and restore running games at
will.

As I mentioned in a previous posting (a couple months back, I guess)
you'll need to do some tweaking to get it running smoothly, but it's
simple enough to do.

I've also decompressed the Dungeon Master program, and gotten it to
load that way off my hard drive, but it was a tedious process patching
things so it didn't always look for data on drive A. I got tired of
it too, so I haven't decompressed the data file yet. I just use Switchback
to load games now anyway.

Hi,
I guess I am against splitting up the Atari group, because thanx to my curiosity I will anyway read both of them, to be sure I didn't miss any details of importance.
I feel people want a tech group to avoid this incredibly boring and childish discussion about the stringency in writing a NO or a YES on a line and similar things. There's often endless talk about things that don't belong to Atari at all and should be confined to private e-mail. Not to talk about all those people who feel the same behind the keyboard as the timid family father once he is behind the steering wheel, starting to swear at the other drivers.
Besides, all those quoting 50 lines of message incl. headings, just to add a "me too"... Some discipline and we can still remain in the same family.

Revolver is a commercial program that does the same thing, with more bells
and whistles. It can create several virtual computers, and has some nice
features in addition imbeded in it (ie mouse accelerator, controll functions,
etc). It also gives the capability to "roll out" a partition of memory
(saving all memory and register states) to a file to be "rolled in" at a later
date. This is nice for stuff that takes some time to load (ie a zillion font
files for a GDOS application), as it is saved as one big file and can be
loaded rapidly.

4452. Re: Help with copy protected games

Newsgroup: comp.sys.atari.st
Date: 1990-05-20 07:46:10 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <30076@cup.portal.com>
Source record: 240797

Rob Demillo asks about Dungeon Master:
>Can someone recommend a disk copier that will allow me to
>install these games on my hard disk? Or, instead, does anyone
>know if the companies that make these games will sell me a
>hard disk installable version?

This is the #1 most asked question of FTL, about Dungeon Master..
(I can't say anything about the other game, Dark Castle.. I've never seen it)

The answer to both questions is no... FTL has no HD installable version,
and they've said that the main part of the time it taked to boot the game is
taken up in decompression in memory, so loading the game from HD would save
very little time.

I know it's annoying to have to wait (it's almost 3 minutes.. I've timed it!)
while the game boots... and I've booted it just a few times myself.

One bright spot though... the #2 most asked question was "Why can't I use
my "B" drive to Save games?" ... and FTL not only listened, and made the
change for Chaos Strikes Back to allow using both drives, but the game
is a little easier to load, since you don't have to switch disks. You can
click on "Resume" and walk away, get a drink or whatever, and it'll be ready
to play when you get back. (Now if only you could hit "ESC" and bypass the
opening screens...)

From the Dutch STart, May 1990:

Ethernet netowrk cards for the ST

1) Atari net, Atari Germany, >1200 dutch guilder/node
demonsrtation at CeBit, ST's connected to TT server (Mega bus card).
2) Bionet, BioData, MS-DOS file server (or ST -> limited set-up), fl 2.177/ST
(full review, stable & workable network, DMA port version)
3) pam's net???

Furthermore MIDI nets

1) SGS
2) eLan

In case anyone wanted to know: our local dealer got it's first TT, more to
follow in June.

4454. Re: Does anybody no anything about UNIX on an Atari ST

[capabilities description deleted]

>Well, it made itself to become a very good OS in its V1.5.X versions,
>which are not official, but from a nice man called Frans Meulenbroeks.
>Therefore you'll not be able to buy it.

[stuff about buying V1.1 deleted]

If I got it right from Frans' answers to some foulups in crc matching (see
comp.os.minix if you don't know what I'm talking about here) MINIX ST 1.5.10
WILL BE AVAILABLE from PH. (Frans mentioned sending in a set of diskettes
to PH and Mr. Tanenbaum, often called Andy, sent in the PC 1.5.10 version.
HOWEVER, nobody know how long it will take PH to come out with the new version.
If you are a patient fellow, you can save yourself the upgrade hassle and wait
for PH to sell the thing. Supposedly this will come with a new enhanced manual
booklet.

>You can get the famous GNU full ANSI C compiler, too. Some 100 standard
>unix tools are included, e.g. sed, awk, yacc, vi-clones, etc. I like it
>very much.

Just for interest: the GNU C I've got has it's own include files and library
functions. These would probably have to be updated for MINIX ST 1.5.10 since
they now relate to MINIX 1.1. Anybody out there who's already done that?

> I am still looking for info on hooking up Atari STs to an ethernet network.
> Are there any networking products for this machine?
> C'mon. Someone must know.
> Thanks.

Over here in Germany there's a thing called Bionet (from Biodata GmbH or so).
This IS a REAL Ethernet thingy with I think TCP/IP on top of it since it is
advertised to hook up Atari STs with IBM PCs, UNIX machines etc. and I don't
think Biodata developed new cards and device drivers for UNIX machines.

Then there is an Ehternet controller from Vortex Gmbh over here in Germany
which was shown at the CeBit if I read things right.

All of these are connected to the standard DMA port so they should be speedy
enough for the standard 10 MBit Ethernet cable.

Naturally I don't know about what's marketed in NA. But this should at least
show you that there are networking products for the ST somewhere in this world.

4457. Modula-2 for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 02:46:40 UTC
From: Seitz@cup.portal.com
Message-ID: <30093@cup.portal.com>
Source record: 240702
Cross-posted to: comp.lang.modula2,comp.sys.atari.st

I'm interested in buying a Modula-2 compiler for my Atari 1040 ST. If you know of any, please let me know. I'm looking for the following features:

1. Complete documentation, including

A. Any differences from PIM2 4th ed.

B. Full documentation of all library modules, including the PIM2 Standard Utility Modules (if these modules are included).

2. High-level graphics, windows, menus, and mouse libraries. I'd like libraries at least as powerful as the PIM2 Windows, Text Windows, Graphic Windows, Cursor Mouse, and Menu libraries.

3. Integrated editor that marks where errors occur in your source code.

4. Source level debugger.

5. Programmer's workbench for tracking and managing modules.

Matt Seitz

4458. Request for 1.44 meg drive docs

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 03:24:00 UTC
From: WSCART01@ulkyvx.BITNET
Message-ID: <904F292C2CFF600C9E@ulkyvx.bitnet>
Source record: 240701

Help! I've been trying to connect a 1.44 meg drive to my Mega and seem
to be doing something wrong and I don't know what. Repeat, HELP!

What I have done so far is run three wires to a switch. One lead goes
to the 8 MHz line of the WD-1772 chip, line two goes to the socket of
that pin, and line three goes to the 16Mhz line of the shifter. I throw
the switch and it takes regular mode (one and two connected 8Mhz) to
HD mode (one and three connected 16Mhz). This doesn't work for me.
I've tried formatting it in HD mode with no luck and have formatted
some on an IBM in HD mode which wont work either. I'm lost as to what
to do next.
Some more relevant information is that the WD-1772 was made in 1985
and the HD drive is a TEAC FD-235HF with OP and D0 dips on. Anyone know
what the settings should be for a TEAC? (Options are HHO OP LHI HHI D1 D0
and I can pretty much guess that D1=drive 1, D0=drive 0 where D0 must be
set for the ST.) Another problem I've encountered is that I cant seem
to get the drive to work with the Mega drive A connectors but seems to
work OK in drive B. (In standard DSDD mode of course.)

I was hoping that someone has the upgrade docs for the 1.44 meg upgrade
so that I could find what I did wrong. (Or that someone might find my
mistake from reading this.) I was also thinking my 1.44 meg formatting
program might also be at fault so if someone could E-mail me a theirs,
or test mine to see if it truly works, it would be appreciated.

Thanks,

Stuart Carter
University Of Louisville
Physics Dept.

4459. Request for 16Mhz CPU Upgrade Information

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 03:41:00 UTC
From: WSCART01@ulkyvx.BITNET
Message-ID: <904CE2BBDDDF600C9E@ulkyvx.bitnet>
Source record: 240703

A few months ago, the big rave was putting in a 16Mhz CPU into your ST computer. Major drawbacks were the price/performance of these upgrades. Two of the best that come to mind are the Turbo16 which used a caching system to boost speed up to 50% better, and the simple upgrade to the CMI board which supposedly was little more than a 16Mhz CPU which was much cheaper but also only 10% improvement. Now we come to my basic question. Why cant I just buy a 16Mhz CPU for $15 bucks and get that 10% increase in speed.

I'm skeptic that this would work since I've never heard of it being done before but would like to make sure since it seems like such a simple idea.

Thanks,

Stuart Carter
University Of Louisville
Physics Dept.

4460. Re: Still looking: Ethernet for Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 04:20:27 UTC
From: Aaron.Roydhouse@comp.vuw.ac.nz

Source record: 240704

In article <4818> bointon@kcl-cs.UUCP (Marcus Barnaby Bointon) writes:
|There was a british thing called "9-Tiles" which was a
|LAN system that could support ST, PC, Mac etc all at once, but I have
|not seen it for a while. Hope this is of some help,

I've just installed and tested a 9Tiles system. Works well.

We're basically evaluating it at the moment, we have a couple
of ST(e)'s and a PC on a ring (it's a buffer-insertion, ring
style network). The PC's & ST's function wonderfully together.

Ethernet it ain't, but fast, functional, reliable, and _very_
useful it is (so far anyway).

If anyone is extremely interested then I'll post/email something
more detailed, but briefly;

Points for:
- 2Mbits raw ring speed (deliveres about 27k/s in pactice,
1st Word plus loads is less than 10sec)
- ST/PC (several other computers as well, but not that we've
tried) integration works flawlessly. The possibility is
you buy a cheap PC-AT (with cheap _reliable_ HD), load it
to the gills with serial/parallel ports (attached to printers,
lasers, plotters, modems, other networks, etc.) and sit it
in a corner of a ring fileserving, spooling, and offering
all its devices as network services.
- Sturdy; plug in, rip-out, crash any node on the ring, anytime
without any problems. You can even break the ring (while
installing another node box say) and all network activities
pause - until the ring in intact again, where upon everything
continues as if nothing had happened.
- You can have as many file-servers as you like on the same ring.

Points against (we haven't had too long to find these yet)
- Only 2Mbits, systems like LANTECH are promising 10Mbits.
- Only PC's (ie. not ST's) can be used as file-servers (although
the can of course serve files to ST's) - this is because the
software only exists for PC's. 9Tiles do provide a ST netbios
with full development information.
- Only PC's can spool printers (again, s/w available for PC's
only), but intelligent serial node boxes can be used to
share printers on an all-ST network.
- Printed docs a little out of date (stuff supplied on
disk [lots] is current and accurate though).

Did I say brief? :-)

Pricewise 9Tiles is no cheaper than other venders, although
service and backup has been very good so far.

Someone else in NZ are presently installing the LANTECH
product for evaluation now - promises to be faster (10Mbits)
but may work for ST's only. (LANTECH are US based I think)

BTW I've got nothing to do wih 9Tiles (or LANTECH) apart from
being located as far away from them as is possible, while still
remaining on the same planet :-)

BBTW We communicate via fax, being on opposite sides(?) on the
globe we are never awake at the same time, but they still manage
to reply within 24hrs of our faxes. (they even faxed us a complete
copy of the ST installation manual (about 50 pages) while we were
still just inquiring about the product!)

Aaron.

4461. Second CALL FOR VOTES: comp.sys.atari.st.tech

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 06:54:20 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May18.134522.29252@wam.umd.edu>
Source record: 240705
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st

[I *did* receive a call for discussion for this group, contrary to my
earlier statement. My apologies for any confusion caused. -eliot]

[This is the revised version with less-strict wording. -dmb]

*** PLEASE READ THIS ENTIRE MESSAGE BEFORE REPLYING ***

This is the first call for votes for creation of a new group

comp.sys.atari.st.tech

The voting period will last until 11:59 PM on June 7, 1990.

*** DON'T VOTE UNTIL YOU READ THE WHOLE MESSAGE! ***

The charter of the group, if created, will be as follows:

Charter for comp.sys.atari.st.tech
---

comp.sys.atari.st.tech is devoted to technical discussion
regarding Atari ST software and hardware. Examples of topics to
be discussed in this newsgroup include:

"What are the pinouts for the ___ port on the ST?"

"Has anyone managed to hook up a ___ successfully?"
(Assuming this is a nontrivial task)

"Which system vector controls ____?"

"What is the official, Atari-sanctioned method of doing ___?"

"What are the specs for ___ file format?"

"How does ___ manage to get 20 million colors on the screen?"

"What is the best way to do fine scrolling?"

Examples of topics NOT to be discussed in this newsgroup include:

"How do you get past the dragon in ___ game?"

"For sale: ___"

"New product announcement: ___"

"My ST is better than your ___ because"

"My ___ is better than your ST because..."

"Atari's financial situation is ___"

---

comp.sys.atari.st.tech, if created, will be unmoderated.

HOW TO VOTE

To cast a vote, send a mail message to dmb@wam.umd.edu with either of
the following subject lines:

Subject: Vote YES for comp.sys.atari.st.tech
Subject: Vote NO for comp.sys.atari.st.tech

In the previous call for votes I stated that the body of the message
would be ignored. This was so I could write a script to log votes
automatically, and to ensure that I wouldn't get ambiguous votes.

However, it has been pointed out that this is too strict, so forget
I ever said it. I will look at the body of the message, and votes
that contain unambiguous subject lines or text will be counted.

If you've sent in a vote with the text in the body, you don't have
to resend; I've already gone through all the votes by hand to make
sure they all got counted. I have not received any uncountable votes
yet.

I will still enforce the following, however:

ONLY votes MAILED to dmb@wam.umd.edu will count. Votes posted to the net
for any reason (including inability to get mail to dmb@wam.umd.edu) and
proxy votes (such as having a mailing list maintainer claim a vote for
each member of the list) will not be counted.

In defense of this, I refer doubters to the *latest guidelines*, which I
have quoted below:

Article 523 of news.announce.newusers:
Subject: How to Create a New Newsgroup (Updated: 16 Feb 1990)

4) ONLY votes MAILED to the vote-taker will count. Votes posted to the net
for any reason (including inability to get mail to the vote-taker) and
proxy votes (such as having a mailing list maintainer claim a vote for
each member of the list) may not be counted.

Looks pretty similar. I didn't just make this up. If you don't like
it, please post a message to news.groups complaining about the guidelines,
not about this call for votes.

The group will pass/fail according to the following criteria in the
guidelines:

3) AFTER the waiting period, and if there were no serious objections
that might invalidate the vote, and if 100 more YES/create votes
are received than NO/don't create AND at least 2/3 of the total

number of valid votes received are in favor of creation, a newgroup control message may be sent out. If the 100 vote margin or 2/3 percentage is not met, the group should not be created.

Additionally, I have extended the voting deadline to June 7 to accommodate the delay in posting to news.announce.newgroups, so we'll be sure to have the >= 21 day voting period called for in the guidelines.

Voting deadline: 11:59PM June 7, 1990

Dave Baggett
dmb@wam.umd.edu

It can be done alright. The thing is to get a 16 MHz signal, and redo
some of the bus connections. It was done by the German ST Computer
magazine, and requires only a few TTL chips besides the 68000. Mail
for further info (I need to dig it out at the library).

>>
>>I have made the following calls:
>>
>>... for(track=0;track<MAXTRACKS;track++)
>>Flopfmt(buf, intbuf, device, sectors, track, side, interleave, magic, pattern);
>>...
Flopfmt() uses a very wide spacing between sectors. To squeeze 11 sectors onto
a track you'll have to write your own formatter routine with direct FDC access.

>I've written a program to do this, but I don't use it. The 11 sector format
>is too unreliable. However, if you want the info without shelling out the bucks

I disagree. I've probably written the first 11 sector formatter ever for the
ST (in late 86), and since then I've been working with it. If you have a
drive that spins at the correct speed (300 UpM) everything works fine.

>sector 1 to be read. I was pretty impressed, though it's unfortunate that you
>can't get this high speed performance and use 10 data sectors per track.

One can get nearly as much from a 10 sector disk. Use HYPERFORMAT (this is
my formatter), and you'll get very high speed 10 sector disks.

The Vortex solution doesn't do DMA, it uses the processor to move data.
At least this is what the Vortex press releases stated.

```
The reason the trick with Fgetdta doesn't work for determining the name
of a program, is that Pexec sets up a DTA that is located in the
basepage of your program. So, this DTA DOESN'T hold the name of your
program! When you make a program which has to know part of it's name
(for example BUFXXXX.PRG where XXXX is the buffer size), you can use a
Fsfirst("BUF????.PRG", 0) and determine the value of XXXX from the DTA.

Hi

Well, I remember reading this post about Mac I and I don't remeber
seeing any name Chad attached to it. There may be other Chad's posting
but I didn't see my name associated with this (please excuse me if a
Chad did post this). However, I didn't post the note about Mac Is. And
though not a Mac person (yet -- thinking of trading my ST for a Macplus
or SE [for the new cheaper edu discount prices] for MIDI), I haven't
heard people call the original Macs Mac I. I have heard "Classic Mac",
"Fat Mac", Mac 128/512/512ke, etc, but never Mac I. And there are other
Macs besides Mac IIs now, the Plus, SE, and SE/30. Apple calls them
"Compact Macs" and "Modular Macs". Anyway, in the future please post
more identifying info and not just a first name when making accusations
(a net address identifying who you are talking about is a start).

4470. Teac drive mechanisms

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 13:14:39 UTC
From: ee86djg@cc.brunel.ac.uk
Message-ID: <1508@Terra.cc.brunel.ac.uk>
Source record: 240720

In response to a plea concerning some brand of second drive, Master??, the following info may be useful.

As a lot of people know, the ST works out disk changes by polling the write-protect signal from the drive, hence ESC to update et al.

Therefore, if this signal ain't working funny things may happen, including strange info in the about.. dialog.

Why doesn't it work ? Well, some Teac mechanisms seem to have taken the 3.5in disk standard slightly too far..

The drive includes a sensor switch to detect disk loaded, which is used by many a computer, but not the ST. The funny thing is, this signal is used in Teac mechanisms to disable logically meaningless signal, along the lines of..
" How can the disk be write-protected if there is no disk loaded "

The solution is to check whether your mechanism fudges these signals, and if does, get out the soldering iron and patch in a jumper.

4471. TurboDos suspected bug

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 13:52:44 UTC
From: ee86djg@cc.brunel.ac.uk
Message-ID: <1509@Terra.cc.brunel.ac.uk>
Source record: 240722

For those of you who are not familiar with it, Turbodos is an auto folder program that claims to replace the standard hard disk drivers with faster routines. And it works, apart from having to be careful with floppies. Oh, and the following:

TurboDos appears to truncate files when copying from one hard disk to another. It will truncate either long files or files within multiple copies. Turbodos does not truncate all files.

This "bug" was discovered when we had two hard drives DMA chained as follows:

Atari-----> Rodime 218Mb(SCSI 0)----->Seagate 157N (SCSI 1),

Both drives use Supra interfaces, and Supra software also used.

Bug did not appear when copying between partitions on a single drive.
All normal procedures concernig disabling desk accs and other Auto progs tried.

Can someone investigate/confirm this phenomenon.

Incidentally, it has been reported (A. Ramos, 2nd Manual to ST) that the Turbodos routines were written by D. Laurent of Atari France, and that they were to be used as the hard disk driver in the new TOS. (That is, TOS 1.4/1.6....we still don't have it in the UK). If so, it might be worth checkin whether this problem exhibits itself on Rainbow TOS set-ups.

PS Use a BIG file to check it, and look at the size of the copy.

As many of you are bored to hear again, I use a Thomson Ultrascan (which is internally the same as the original Mitsubishi Diamond Scan) as both color and mono monitor. I agree with Larry Rymal that the mono isn't as good as on a real Atari mono monitor. But I consider it excellent anyway. Comparable to PC VGA. It may be that we have different standards, or perhaps different cables (mine runs the mono output to the green monitor input only).

> [Discussion of 2 CPU upgrades deleted]
>Why cant I just buy a 16Mhz CPU for $15 bucks
>and get that 10% increase in speed.

My understanding is that the speed of the machine is actually not based on the CPU, but the clock. The ST's clock runs at 8MHz, so popping another chip in there, no matter how fast it is, will still execute instructions at 8MHz. Another problem is the RAM. The stock RAM in an ST has a 120NS access time, so that's just fast enough for 8MHz (125NS would be exactly 8MHz, 120NS is slightly faster). If you double the clock rate and pop in a 16MHz CPU, the CPU will spend most of its time waiting for RAM. Which brings me to my question:

I just upgraded my 1040ST to 4MB using 1MBx8 SIMMS with 80NS access time. Is it possible to just double the ST's clock rate and pop in a faster CPU to get a faster machine?(I realize that the SIMMs aren't fast enough to run at a full 16MHz, but they're a lot faster than regular ST RAM chips) Also, is it possible to make the clock rate switchable between, say, 8MHz and 16MHz so I can still run games that are dependent on CPU speed?

4475. MASTER drive from Oceanic is buggy

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 18:01:30 UTC
From: dbrooks@osf.org
Message-ID: <8306@paperboy.OSF.ORG>
Source record: 240715

Thanks to those who responded concerning the Master 3S 2-sided drive from Oceanic. Konyo acknowledges that the design is faulty, and will fix/replace your drive. If you call them at the number given on the warranty card (sorry, I don't have it to hand) and ask for Service, they will arrange the swap. They don't seem to be prepared to do it through a dealer, which is a pain.

To find out if you have the problem (with this or any other drive), insert a write-enabled disk and get a GEM listing. Then pop the disk out, count to one :-), and push it back in. Hit Escape. The disk should spin. If it doesn't, you have a problem.

If you really need not to lose the drive for a while, or you have the same symptom with another drive, the workaround is: *never* replace a write-enabled disk with another write-enabled disk. Always insert a write-protected disk in between. For the few days I had to do this, I'd take the "new" disk, open the shutter, slide it in, wait a moment, pop it out and close the shutter again.

Good luck, everybody with the drive.

From: aimd@castle.ed.ac.uk
Message-ID: <4111@castle.ed.ac.uk>
Source record: 240721

If you are a subscriber to ST World (UK), then you'll know this, sorry!

From next month ST World will appear quarterly (!) and increase it's size upto about 120pages (only 24 pages more than the current issue).

Atari ST User is being re-vamped (and it certainly needed it). It looks as though ST User will become the ST World with games reviews. I guess it'll look something like Amiga Computing. It will also have a cover disk with some programming pages on the disk.

All in all, the new ST User sounds quite good, it'll obviously be competing mainly with ST Format but sounds like serious users will be catered for to a large extent while also satisfying more casual users.

ST World looks like it'll take a bit of a back seat. It's hard to see everyone remembering when ST World is coming out when it's been three months since the last issue.

Subscribers can carry on with ST World, switch to ST User or pay 30 quid and subscribe to both!

The new ST User is out on 7th June, should be an interesting read.

Mark.

4478. Editable text fields in Dialog Boxes

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 20:15:44 UTC
From: heavy@sparky.eecs.umich.edu
Message-ID: <2375@zipeecs.umich.edu>
Source record: 240716

I need some help, bad. I am working on a program, in which I use dialog boxes. The following segment of code copies a string into an editable text field, calls form_do, then tries to get the edited string out. This whole portion of my code worked fine, until I started trying to get the edited strings out of the dialog box, so there would seem to be something wrong with the way I am doing that, any suggestions? Here's what I am doing:

```
...
strcpy((char *)((TEDINFO *)edit[NAME].ob_spec)->te_ptext,oldstring);
objc_draw(edit,0,20,x,y,w,h);
ret = form_do(edit,ITEMID2);
strcpy(newstring,(char *)((TEDINFO *)edit[NAME].ob_spec)->te_ptext);
printf("%s\n",newstring); /* This line crashes massively */
...
```

It should be noted that the first strcpy works.

Thanks in advance,

Richard Hall
University of Michigan

4479. DMA problems since adding Turbo-16 upgrade

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 20:17:26 UTC
From: dag@persoft.com
Message-ID: <1990May21.201726.552@persoft.com>
Source record: 240718

About a month ago, I purchased the Turbo-16 board (by FAST Technology) and installed it in my Mega-4, following the printed directions very carefully. After a few phone calls to the technical support people at FAST, I was able to get the upgrade to operate by removing the Blitter chip (the doc's said nothing about incompatible Blitter or MMU chips, but the man on the phone told me that my Blitter was not compatible and that I must get a new one...). The upgrade now works, and the processing speed improvement is impressive; however a problem immediately developed which maybe some kind soul on the net can help me with before I send the machine in for service. (There is no competent service center that I know of within 100 miles of Madison, WI.)

The DMA chip now stops talking to the hard drive (though it will still talk to the floppy controller without complaint) once the surface temp. of the chip gets above 95 degrees (F). Immediately after installing the upgrade, this took about 5 minutes, but I installed a heat sink on the DMA chip, and I can now go for about an hour before the DMA port stops talking. On a scope, the DMA signals just get very mushy and the voltage drops until the disk stops talking to the ST.

It used to be, before I installed the Turbo-16 board, that when I powered up my hard drive with the ST turned off, it would go through its entire selftest. The busy light on the drive (Megafile 30) would then go out and I would turn on my ST, which would auto-boot from the drive, and everything was happy. I often left this configuration on for days at a time without problems.

Now, since I installed the Turbo-16 board, when I turn on the hard drive with the ST turned off, it goes half way through its self-test and then hangs with the busy light on until I turn on the ST, at which point it finishes the self-test while the ST is starting its powerup sequence, and the ST then auto-boots from the drive without difficulty. It is later that the hard drive becomes inaccessable (while the floppy is still just fine.) A burst of cold spray on the DMA chip makes the drive accessable again for a little while, but this is not a good way to solve this problem.

Given this change in behavior, I suspect that something electrical changed due to the modifications required by the upgrade which changes the load on the DMA bus somehow.

Does anybody have any good ideas? Bad ideas? I'm planning on calling F.A.S.T., but I cannot find where I put their phone number.

4481. everex (lack of) service

Newsgroup: comp.sys.atari.st
Date: 1990-05-21 22:06:15 UTC
From: kjh@pollux.usc.edu
Message-ID: <24812@usc.edu>
Source record: 240719
Cross-posted to: comp.sys.ibm.pc,comp.sys.amiga,comp.sys.apple2,comp.sys.atari.st,comp.sys.cbm,comp.sys.hp,comp.sys.mac,comp.sys.tandy,comp.sys.xerox,comp.sys.zenith

In February, I bought a Seagate 4096 80M drive that was repackaged by Everex. I couldn't get it running at that time because not only was the everex documentation skimpy, it was JUST PLAIN WRONG! I had to call back the vendor several times to get the correct information. At that time, I posted a message saying that the everex documentation was so bad that I would never buy another everex product.

Now my disk has crashed. I tried to call everex several times today, in order to return it to them and have it fixed or replaced under the warantee. (It's only 2.5 months old!) Well, I got hung up on. I got put on hold indefinitely. When you call, you get one of those automated recordings, and you never get to talk to a live person. I NEVER got through to a person who could help me. Everex not only has terrible documentation, they also have terrible service (actually no service at all).

I recommend that you take your business to other companies, and avoid everex.

I'm not scared of the everex laywers either. You can't sue me for slander, because everything I have said is true.

I am sure that several people will post saying that they like everex products, or they have not had any problems with everex. My point in posting this is to warn you that what happened to me could happen to you. I would avoid buying any everex products.

The vendor that I purchased the disk from has agreed to help me. If it wasn't for them, I would never have gotten the disk running in the first place, and I wouldn't be able to get it fixed now either.

What are the alternitives for debugging machine code with the atari st? I have a good cross assembler running on a 386 XENIX system that I would like to use, (not an atari based assembler). Getting the object file into the Atari's memory does not seem to be a problem.

The question is: what are the choices for a superior machine language debugger running on the Atari ST. The assembler/editor part of such a package is not important, just the debugger.

From: optimiza@utrcu1.UUCP
Message-ID: <292@utrcu1.UUCP>
Source record: 240724

As far as I know, it cannot be done in an easy way. Each program has its own active directories, and, though these are inherited from the calling program, they cannot be 'inherited back'. At least, not in an official way. There are the so-called 'path-handles' in the basepage (an array of 16 chars @ offset 56), but I think they are for GEMDOS-internal use only. When you want to experiment with them, I suggest the following:
1. Do a Dsetdrv() to the drive you want to set the path for.
2. Do a Dsetpath() to set the desired path.
3. Exchange the path-handles for the drive you want to set of your program and its parent. A pointer to the basepage of your parent-program is in the basepage @ offset 36. You must exchange the path-handles instead of just copying the required handle back to the parent, because GEMDOS keeps track of the number of times a path-handle is used.

As you see, it is a lot of fuss, but I think this might work.

There are many different clocks running inside the ST, including 8, 16,
and 32 MHz clocks. Unfortunately the CPU and MCU are driven off the 8 MHz
clock. So the last statement above is true - if you drop in a 16 MHz cpu
and feed it the 16MHz clock line, presuming no other problems (an unrealistic
assumption, of course...) you will still have to wait for the RAM.

Apparently there is no way to get the ST running properly with 16 MHz fed to
the memory controller. Perhaps it just isn't capable of operating at that
speed, or maybe some other interaction with GLUE rules it out. This is all
hazy info from a message exchange with Jim Allen. At any rate, it isn't very
feasible, or else it would probably have been done for Turbo-16. I don't know
what the German Hypercache does, but from the sound of it they also resort
to using a cache instead of upping the clock on the memory controller. (This
isn't an issue in the TT, probably, since the 68030 has the memory management
unit integrated onto the CPU chip. Probably also explains why you don't see
too many people talking about putting 68020s in STs, since the '020 would
still need an MMU somewhere. Not that it hasn't been done, just that no one's
tried to market such a beast.)

The Turbo-16 doesn't allow switching the clock rate. I guess the extra hardware
just won't run properly at that speed, or maybe would run too slowly. The
slowdown switch on the Turbo-16 disables the cache to achieve the slowdown
effect. This pretty much leaves you with what you'd get with a CMI or other

no-cache accelerator, i.e., average of 10% faster than normal.

I wonder why no one ever marketed a 68010 based accelerator. Not enough zip
to be worth the trouble?

> 1) Do these things work with all (most?) ST software?

Turbo-16 seems to work with most stuff. Some copy protection schemes are fouled up. My Gauntlet II no longer loads. Apparently the Notator from C-Lab doesn't work, also due to their copy protection. Spectrum 512 is unusable. Dungeon Master works. Falcon works. (My mistake saying it didn't work in an earlier posting....)

> 2) Do any of them allow easy (software?) switching between
> 8 and 16?

No way to get true 8 MHz operation with Turbo-16, other than to pull it out of the socket and plug your 8 MHz chip back in. Not something I'd want to do often, if ever, since the T-16 board can be damaged by flexing. But you can rig it up for software, hardware switching or both at once. The software switch requires running a line from the T-16 to the Yamaha sound chip. Dan Wilga (of Gribnif fame) wrote a small desk accessory that handles the actual switching operation. Anyway, all the switch does is toggle the cache.

> 3) Does it really matter how fast your RAMs are?

Not with Turbo-16. Dunno about any other boards. CMI is no longer in existence, so I guess the only ones to look at are JRI and Datafree. (Is Datafree still around?)

chad@norge.enet.dec.com writes:
>To be fair to the XEGS, there were lots of cartridges available. Any of
>the 400/800/XL/XE carts should work and there were some great games.

Actually, that's very true... the latest B&C Computervisions ad in AIM
magazine lists *82* "Entertainment" cartridges for the 8-bit Atari,
and a couple of dozen more under Productivity and Education...

And a lot of these ARE good games... but... VERY, VERY few of the games
are as new as the XE-Game System, and MANY of them harken back to the dawn of
the 400/800 (11 years old, that is). Very few of the promised new titles
for the XEGS ever saw the light of day... and you just can't support a
game system on old games...

When your next-door friend tells you he just got "Super Mario III" for his
Nintendo system, what are you going to reply..? "Well... I've got
3-D Tic Tac Toe and Super Breakout..."

All of which makes me just a little bit leery when Atari says they'll have
24 new games out for the Lynx by next Christmas...

> Including my own.)

Well, when my 1040's internal drive went south, I took it to a
Atari authorized service center, and they replaced it with "some"
sort of non-standard drive, the result being it didn't recognize
media changes. Since it had taken them nearly two months to do
that, I didn't feel like waiting another month and sending my poor
computer back through the mail, so I soldered a jumper between
proper pins as you describe.

Result: For awhile it was fine, and most of the time now, it is fine, and
everything works correctly. Except sometimes, usually after having
the computer on for several hours, I'll go to save something to the
disk, and no matter what disk I put in, or how many times I swap,
I get a message that the disk in drive A is write protected. This
can be a real pain since it's my only drive.

Hopefully I have a reset proof ram disk loaded in which to save my
file, otherwise... oh well...

From: ljdickey@water.waterloo.edu
Message-ID: <1990May22.013238.22811@water.waterloo.edu>
Source record: 240728

In article <328@nic.stolaf.edu> pearsonm@agnes.acc.stolaf.edu (Matt Pearson) writes:

>I have an IBM PC/AT with a program that lets me use these Atari Sounds.
>If soneone cound send me some NOT archives for I do not have an atari to
unarchive them.

An interesting idea is contained in this message. I hope my experience
will clarify things for you if you have worried about moving things
from one system to another.

Some months ago I did some experiments with ARC on my Atari ST,
on the IBM PC at the office, and on our VAX running Unix.

I created a simple text file on my ST.
ARC was used on my ST to create an archive file containing it and
certain other files.
Kermit was used to transfer the ARC file to the VAX.
I was able to un-arc the files on the VAX.
Kermit was used again to transfer the ARC file from the VAX to the PC.
ARC on the PC was used to extract the original files from the ARC file.
All went smoothly, and the results were that I have perfect copies
of everything on all three systems.

I think that "pearsonm" will be pleasantly surprised to learn that ARC
in one place is ARC in another. ZOO seems to work correctly too, but
I have not done extensive testing. The program that I have had some
trouble with is "LHARC", but I am not sure where the problem is, yet,
since I have tested only on the VAX and the ST.

4489. machine code debugging utility

Newsgroup: comp.sys.atari.st
Date: 1990-05-22 01:35:44 UTC
From: jimh1@veritoo.uucp
Message-ID: <1990May22.013544.24181@veritoo.uucp>
Source record: 240730

What are the alternitives for debugging machine code with the atari st? I have a good cross assembler running on a 386 XENIX system that I would like to use, (not an atari based assembler). Getting the object file into the Atari's memory does not seem to be a problem.

The question is: what are the choices for a superior machine language debugger running on the Atari ST. The assembler/editor part of such a package is not important, just the debugger.

Here at the lake, LHARC is regarded as fish bait. It's right up there with
cheese that you let sit in the back of the car for a week or so.

I've tossed out half a dozen items posted to comp.binaries.atari.st
because they were compressed using LHARC. There are at least three
mutually incompatible LHARC programs. I have better things to do than
play guess-the-archiver.

Another unreliable format is ZIP. I have a couple of disks full of
files packed with PKZIP.EXE on an IBM that cause UNZIP.TTP to bomb.

I don't understand why people want to ruin files in order to save a few
hundred bytes.

ZOO and ARC 5.xx are portable and reliable, as is the Unix compress (.Z)
format (which works only on single files). ARC 6.xx is marred by
irritating bugs in the Atari implementation.

ZOO is my archiver of choice. Probably appropriately so.

>tried to market such a beast.)

A new MMU ? The German magazine (yes one of those again..) c't put in a
MC68020 - MC68881 pair running at 12 MHZ. The major problem was to rewrite
TOS to take out the use of F-line traps.. . Of course, the 68020 probably
looked like a 8 MHz 68000 to the rest of the ST, which could be why
the speed only just doubled (cache in the 68020 + higher clock speed). Great
for number-crunching though.

(I'll find the article about the 16 MHz upgrade today. It is NOT the
one with a gace, just a few chips to make the CPU hang on to the bus.
I really don't think there is much speed there...)

Yes, LHarc is really troublesome. I only know of the .LZH files that
have been distributed via comp.binaries.atari.st - and they came in (at
least) three (!) different formats:

- Some files could be extracted on the ST with LHarc V1.13.

- Others could not be extracted on the ST with LHarc V1.13 but with the
extract-only tool Unlzh.

- And then there was the .LZH file comprising the sources of LHarc
V1.13. Neither
LHarc V1.13 nor Unlzh could extract it. I finally transferred it back to our
Sun where I was able to handle it with the Lharc installed there.

Wrong. TurboDOS doesn't replace any hard disk driver. It replaces most
GEMDOS routines, especially those for locating free space in the FAT,
caching an the like.

>TurboDos appears to truncate files when copying from one hard disk to another.
>It will truncate either long files or files within multiple copies. Turbodos
>does not truncate all files.

No wonder. Is is strange, however, that there are still people who
dare use TurboDOS. It is probably the most bug-bitten utility ever around.
If you use TurboDOS and lose data, it's your own silly fault. Using TurboDOS
is like jumping out of the window in the 13th floor instead of using the
elevator just to save some time on the way down.

Myriads of programs will collide with TurboDOS, and using two hard drives
with TurboDOS is the 'safest' way to corrupt your data with TurboDOS.

Delete it. Get TOS 1.4.

>Incidentally, it has been reported (A. Ramos, 2nd Manual to ST) that

>I wonder why no one ever marketed a 68010 based accelerator. Not enough zip
>to be worth the trouble?

The 68010 introduces some of the same problems as 68020 and upwards.
It has an extra register for its virtual memory management, this register
will be put on the stack on exceptions. TOS must then remember to remove
this extra register from the stack, when it know it is an 68010 cpu. Well
TOS just don't do that (but it seems that Atari are taking new cpu's into
account in the new TOS (1.6 and 030) by having a cookie-jar, where info's
such as cpu and other things can be put).

I think that the 68010 also has MOVE SR... listed as an privilegded
instruction, but I am sure. Anyway it will require a hacked TOS to get
it work a 68010.

BTW I have made the PCB board from the german ST-Magazine which contains a
16 MHz 68000 (also I added the MEGA-bus to the PCB, but I never tested it).

Depending on the utilization of the register on the cpu, the increase in speed
goes from 10% to 35%. The latter was a very fast mandelbrot-program from
the same magazine (the full mandelbrot-set in 6 seconds). But normal GEM
application seems to gain about 10-15% speed increase.

Notice that there is no cache on this board, is only runs at 16MHz when
the cpu is off the bus.

Well, I've "heard of copyright":

A copyright is denoted by a copyright symbol, (c), or the word "copyright" followed by a year and a copyright owner's name. None of this appears in the letter. The fact is, you CAN post mail someone sends you if you so desire. And speaking of e-mail/BITNET/Whatever rules, it is DEFINITELY against the rules to use profanity in email. Before you respond, LOOK UP THE RULES!!! I had originally voted "NO" for this group, but wastes of bandwidth like this thread changed my mind. (I can hear it now... "Then why did you make it worse by posting, blah flame blah...) Can't we find something better to talk about?

>it possible to make the clock rate switchable between, say, 8MHz and 16MHz
>so I can still run games that are dependent on CPU speed?

No.

As I recall, the video (sync) timing is based on the same clock as the
rest of the timing: a 32 MHz crystal.
And the second reason is, that the custom chips in the ST cannot keep up
with higher clock rates (my computer gave up at less than 9 MHz :-).
And funny idead, like adding SRAM with You own adress decoder or the
like, do not work, because the adress registers for DMA transfers and
video are located in the MCU chip, acually.

The only possible solution are a cache and faster access to the ROMs
(they are static and not handeled by the MCU; they can be replaced with
faster chips - say on a piggy-back board on top of the processor or on
the cache board).
Availeble speeders give You fast ROMs *or* cache...

As I understand it the 68000 uses a signal called DTACK to tell it when data
on the bus from the memory is valid. If the DTACK signal in an ST is asserted
after X-micro seconds then it doesn't matter how fast your RAM is, you'll see
no speed improvement unless you also shorten the DTACK time.

16Mhz upgrade units such as HyperCache use their own DTACK signal when
accessing the cache RAM and the default signal when accessing ST RAM.
To maintain integrity during DMA operations, the cache works in write-
through mode (data is written to the cache AND to normal memory). So DMA reads
from memory (writes to disk) will always work properly. After a DMA write to
memory (read from disk) the cache is cleared so that subsequent CPU memory
reads are taken from the real RAM rather than the possibly incorrect cache.

A friend of mine installed HyperCache in his ST a while back and the speed
up was very noticeable. Unfortunately things went horribly wrong and a bit of
solder melting in the wrong place trashed his circuit board. He now has a
STE, no worries!

So, basically it's all to do with DTACK.

Dave.

4505. Programs and abilities of STe

Date: 1990-05-22 16:33:56 UTC
From: GHGADMT@BLEKUL11.BITNET
Message-ID: <22May1990163612165@BLEKUL11.BITNET>
Source record: 240601

Can anyone send me programs (Demo's, and so) which use the special abilities of the Atari STe 1040? I need them for a Computer Show in our school. Anything will do.

Are there also more serious programs (graphics, ...) which can use the 4096 colours (if possible all together), and the hardward scrolling?

Are there demo's (and how to get) from Atari itself?

Regards,

Van Hout Kurt,
GHGADNL @ BLEKUL11.

4506. OO-GEM Proposal and Smalltalk-80 question

Newsgroup: comp.sys.atari.st
Date: 1990-05-22 18:35:01 UTC
From: bhodges@blackbird.afit.af.mil
Message-ID: <1598@blackbird.afit.af.mil>
Source record: 240748

I have seen several articles on Smalltalk-80 and because of a growing interest in object oriented things (OOP, OOA, etc.) I am interested in buying it. However, I called Parc Place in California and they don't know of a version for the ST. I am interested in any OO language that has a stable version for the ST. Any suggestions?

Now, enough of the Smalltalk, here's the OO-GEM proposal:

I am interested in exploring, through lively public discussions, the idea of encasing the ST hardware and software (GEM mainly) in an object oriented shell. When I say object oriented, I mean PURE OO i.e. everything is an object. Smalltalk and Actor are examples of pure OO languages. C++ is not. Thus, my ST with all its wonderful graphics and the like could fit smoothly into an OO environment. What d'ya think?

> self tests, and the ST parallel port used to work with my old printer.

I just got a LaserJet IIP and I found the same problem. To "fix" the
problem, I turned on the LaserJet IIP before turning on the Atari and
it works just fine. I don't know why it works, but I vaguely remember
something written to this notes group mentioning this. Does anybody
know of a better fix (i.e. not having to turn on the printer first).

P.S. I never had this problem with my DeskJet.

>
>Does anyone know the sources to LHARC or better yet information on how
>the compression scheme works?

I wish I could say yes. I have found that LHARC has a better compression on all files I have tested. In a few cases it has been more than 5% better. I am frustrated that the LHARC on my ST is not compatible with the LHARC on my unix system. Whatever is done, we should not get out of sync with the pc world for reasons made clear in a recent posting, namely someone wanted to move some data files from one machine to another.

Does anyone know if any version of LHARC for the Atari is compatible with any version of LHARC for the IBM PC.

4509. X.25 / X.400

[.. flame of Everex deleted ..]

From your posting you imply that Everex have bad service as a matter
of policy.

If this was generally the case then how come they didn't go bankrupt
long ago? Any company that gives consistently bad service is not
going to be a success. I am sure that the directors of Everex are aware
of this and I am equally sure that they have many thousands of satisfied
customers.

You want your hard disk sorted out? Flaming this company either on the net
or on the telephone to them is unlikely to make them help you willingly.
Persistent calls without losing your temper will make them listen to you
and sort out your problem if they operate in a normal sort of way.
Pick any company that has given you excellent service. It is highly likely
that companies such as the one you have just picked will have a few cases
in which everything went wrong...

>I am sure that several people will post saying that they like everex
>products, or they have not had any problems with everex. My point in
>posting this is to warn you that what happened to me could happen to
>you. I would avoid buying any everex products.

You post your article to the net in spite of that? Have you given this
company a chance to reply? Can they read the net?

|> ...
|>
|>It should be noted that the first strcpy works.

Are you sure that the string you copy into the TEDINFO structure fits
into the destination and is not too long? I wrote some functions which
will check this and abbreviate the string if neccessary. Of course you
could not use the te_ptext as a reference to the "original" string which
should be stored elsewhere. Here is some food for the source code hunters:

#include <obdefs.h>

/* This function calculates how many characters can be displayed in a given
TEDINFO structure.

Parameter:
object: Object the TEDINFO structure belongs to

Return value:
The number of characters that can be displayed in the TEDINFO
structure.
*/

int TedinfoDisplayLength (object)
register OBJECT *object;
{
extern int graf_handle ();

register int i, result;
register char *c;
```

```
register TEDINFO *tedinfo;
int char_width, char_height, char_bwidth, char_bheight;

tedinfo = (TEDINFO *) (object->ob_spec);
graf_handle (&char_width, &char_height, &char_bwidth, &char_bheight);
/* Ok, I admit the character width should really not be estimated
with graf_handle (which gives the size of the system font) but
with some other function which depends on the specific font of the
TEDINFO structure.
*/
result = object->ob_width / char_width;
for (i = 1, c = tedinfo->te_ptmplt; i <= result && *c != '\0'; i++)
if (*c++ != '_')
result--;
if (result > tedinfo->te_txtlen)
result = tedinfo->te_txtlen;
return result;
}

/* The function "StringToTedinfo" writes a string into a TEDINFO structure
(te_ptext). Care must be taken if the string contains more characters
than can be displayed in the TEDINFO structure: The front or rear of the
string will be replaced by an abbreviation string.

Parameters:
string: The string that should be displayed
object: The object containing the TEDINFO structure
front_or_rear: Indication where to abbreviate the string if neccessary
abbreviation: Abbreviation string

Return codes: 0: string fits fully into te_ptext
1: string fits into te_ptext abbreviated
2: string does not fit into te_ptext, not even
abbreviated
*/

#define FRONT 0
#define REAR 1

int StringToTedinfo (string, object, front_or_rear, abbreviation)
register char *string;
register OBJECT *object;
int front_or_rear;
register char *abbreviation;
{
register int string_length,
tedinfoLength,
new_length;
register TEDINFO *tedinfo;

tedinfo = (TEDINFO *) (object->ob_spec);
string_length = strlen (string);
```

```
tedinfoLength = TedinfoDisplayLength (object);
if (string_length <= tedinfoLength)
{
strcpy (tedinfo->te_ptext, string);
return 0; /* string fits fully into te_ptext */
}
else
{
new_length = tedinfoLength - strlen (abbreviation);
if (new_length <= 0)
return 2; /* string does not fit into te_ptext, not even
abbreviated */
if (front_or_rear == FRONT)
{
strcpy (tedinfo->te_ptext, abbreviation);
strcat (tedinfo->te_ptext, string + string_length -
new_length);
return 1; /* string fits into te_ptext abbreviated */
}
else
{
strncpy (tedinfo->te_ptext, string, new_length);
tedinfo->te_ptext[new_length] = '\0';
strcat (tedinfo->te_ptext, abbreviation);

>>I wonder why no one ever marketed a 68010 based accelerator. Not enough zip
>>to be worth the trouble?

>The 68010 introduces some of the same problems as 68020 and upwards.
>It has an extra register for its virtual memory management, this register
>will be put on the stack on exceptions. TOS must then remember to remove

A German magazine (ct) produced a card with 68020 and 68881 and also developed
a patched Blitter-TOS version. They removed F-Traps and so on and I tested it
with a 68010. But my ST did not get much faster, about 3% to 5%.

With 68020/68881 I got the information, that you perhaps get 20% to 30%, but
at those days, there were not many compilers supporting this card, using the
68020 instructions or even the F-Traps, but now TURBO-C 2.0 has arrived....

Now the best way to speed up the ST is to get a 16MHZ card with cache. I am
using one for about five months and it speeds up the ST about 50% to 75%.
Smalltalk, for example, speeds up from Index 40 to Index 70.

The company is now developing a 68030-16 MHZ card including cache and 32-bit
patched ROM, but the price (>2000.- DM)!!! They will show it on the Atari fair
in Duesseldorf this summer.

Source record: 240611

```
In article <292@utrcu1.UUCP> optimiza@utrcu1.UUCP (de Leeuw) writes:
|As far as I know, it cannot be done in an easy way. Each program has its
|own active directories, and, though these are inherited from the calling
|program, they cannot be 'inherited back'. At least, not in an official
|way. There are the so-called 'path-handles' in the basepage (an array of
|16 chars @ offset 56), but I think they are for GEMDOS-internal use
|only. When you want to experiment with them, I suggest the following:
|1. Do a Dsetdrv() to the drive you want to set the path for.
|2. Do a Dsetpath() to set the desired path.
|3. Exchange the path-handles for the drive you want to set of your
| program and its parent. A pointer to the basepage of your parent-
| program is in the basepage @ offset 36. You must exchange the path-
| handles instead of just copying the required handle back to the
| parent, because GEMDOS keeps track of the number of times a path-
| handle is used.
|
|As you see, it is a lot of fuss, but I think this might work.

This requires quite some knowledge of how GEMDOS uses those
'path-handles'; and if GEMDOS keeps track of who owns what, you're out
of luck.

If you want an simple alternative that will probably continue to work
on future TOSes, just push the address on the stack of the parent of a
function that sets the path. If this doesn't sound too clear, I can
even write it out for you.

Leo.

From: jensting@skinfaxe.diku.dk
Message-ID: <1990May23.083908.1200@diku.dk>
Source record: 240613

jensting@skinfaxe.diku.dk (Jens Tingleff) ((My self)) writes:
[..]

>(I'll find the article about the 16 MHz upgrade today. It is NOT the
>one with a gace, just a few chips to make the CPU hang on to the bus.
>I really don't think there is much speed there...)

I found it (hooray). It's the 10/88 number of ST Magazin. I'll make
a Postscript drawing (++) of the circuit (allowing switching between 16
and 8 MHz, neat) and suggested realisation (PCB on top of socket
inserted instead of original CPU) tomoorow. The quoted speed increase is 20%
on a BASIC program using SIN() functions.

I have received SO MANY replies to my postings on this subject that I
can't answer all of them individually. I try to answer a few questions
here.

The 68020 in the c't upgrade ran at 12[.5] MHz because 16 MHz
parts weren't available at the time of design (these German
magazines are sometimes out EARLY with their designs). At
least that's what I think. The circuit doesn't run at
16 MHz without modifications, though, so perhaps the design
was made for 12 MHz only.

The TOS update to remove the F-line traps (and redo
the exception for priviliged instruction, due
to MOVE SR, insn's) was published as small code inserts,
and a set of ROMs with builtin pathces are available on
floppy and in ROMs. c't is also selling a TOS 1.4 with
patches, I thought someone wrote to me that F-line traps
had been taken out of TOS 1.4 ? what's going on ?

I'll get the addresses for subscription inquiries for
ST magazin and c't tomorrow.

++) objections to the use of Postscript are likely to be ignored.. .

4520. Drive mods & write protect.

Newsgroup: comp.sys.atari.st
Date: 1990-05-23 14:41:59 UTC
From: ee86djg@cc.brunel.ac.uk
Message-ID: <1518@Terra.cc.brunel.ac.uk>
Source record: 240623

After my proevious posting about some drives not propagating their write-protect signals, a posting appeared which causes me to clarify my remarks:

What I suggested doing is basically checking that the write-protect signal is always propagated. The atari polls it often enough to detect the change from not-protected to protected to not-protected when you swap disks. Ie, as a non-write protected disk is removed, the write sensing switch finds empty space, which is the same as a write protected disk. This is why the disk is *always* checked to update FAT info if the disk is write-protected.

Hence, you merely have to ensure that the write-protect signal changes state and holds that state when a disk is removed. In some drives the write-protect is gated with some sort of disk-loaded signal. Finding a way round that is a matter of examining the topology of your drive card.

Well, might as well spew my $0.02:

A child process that changes the environment of the parent process sort of goes against the accepted way of doing things. Anything that a child process does to the environment is supposed to be wiped away when the child process terminates. That's why there is no defined easy way to do this, because you're not supposed to. Of course you could force it by changing undocumented system variables and such, but it would be a maintenance hassle for each version of TOS, and I'm sure it would be incompatible with lots o' stuff.

> the compression scheme works?

> Steven Lee

I'm interested too, especially considering the bugs in all the various ST implementations of it. Is it true that the documentation is still only in Japanese? If it were in Italian or French I could read it, but... Since it is out for Unix and according to one poster, works better there, I assume a good C source is available. Please someone, tell us where it is, ok?

Thanks,
Bob Pegram (Internet: pegram@griffin.uvm.edu)

4525. TECH: My experiences with the JRI SIMMs memory upgrade

Newsgroup: comp.sys.atari.st
Date: 1990-05-23 16:34:55 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <3441@rodan.acs.syr.edu>
Source record: 240618

Here's a summary of my recent adventure expanding my ST's RAM to 4MB using the JRI SIMMs board.

John Russell Innovations
PO Box 5277
Pittsburg, CA 94565
(415) 458-9577

I bought 4MB of 1MBx8 80NS SIMMs from some vendor (I forget) but browsing through the current MacWeek, I found a PSI ad:

PSI, Inc. (800) 622-1722, for $59.50 per 1MBx8, 80NS, you defintely need low profile SIMMS. By the way, the JRI board was $125, so the whole thing can be done for about $350-400.

Here's how it went for me:

The JRI kit arrived and even included some jumper wires and some solder! There are 4 different sets of instructions that you must choose from, depending on your particular ST's motherboard (works for 520STs also, by the way). The differences between the boards are clearly shown. I found that the instructions were a little vague about a couple of things, for example, the instructions keep refering to top,bottom,left,right sides of the shifter board when the proper orientation of the board is never shown.

Basically you have to remove 6 resistors from the motherboard (only 3 if you're just going to 2.5MB) and put in a total of about 10 jumper wires, one of which is a pain because it is a jumper to pin 61 of the MMU, which must be soldered UNDERNEATH the motherboard and then attached to the JRI board. I had a couple of problems with the upgrade, first problem was that the jumper to the MMU that runs under the motherboard got shorted by some of the soldering points under the ST. I solved this by using electrical tape to stick the jumper to the backside of the motherboard in safe fashion. You also have to remove the Shifter chip, which is inside a square tin housing. You then put the chip on a supplied board, which then goes into the socket (thank god a socket was used!) left by the now vacant Shifter. This board has space for 2 shifter chips, which means that if you buy the optional second shifter (can get them at any Atari service place, I guess) you can get 4096 colors instead of the 512 on a regular ST (I haven't done this yet) Anyway, I accidentally plugged the shifter board in wrong, it's difficult to see what you're doing here--not much space. Next problem was that the bottom of the shifter board was shorting out with other components underneath it. I used more tape to fix this. This problem was weird because the machine worked in monochrome, but would bomb out in color. Luckily, I figured it out. Oh, by the way, I noticed the problem with the shorted MMU jumper because the machine only recognized 1MB of RAM. The third problem was

where to put the board and still be able to shut the ST's case. I found the best way was to run all the wires through the shield that goes over the power supply (I had to bend the shield for this) and lay the board between the power supply shield and disk drive ABOVE the big tin shield. I put the board in a plastic bag to hopefully avoid any moisture or spill problems.

All in all, the thing works!!!
The instructions were a little vague in the areas I touched on above, and I wouldn't recommend doing the upgrade unless you are willing to rip your machine apart. A couple of times I thought I had broken my machine, but carefully going over all of the connections helped me find all of the problems.

By the way, you only need 120NS SIMMs, not the faster ones I got, but the savings for the slow SIMMs are probably minimal.

Good luck if you decide to go for it!

4526. LHARC problems ....

Newsgroup: comp.sys.atari.st
Date: 1990-05-23 16:59:17 UTC
From: olorin@tardis.computer-science.edinburgh.ac.uk
Message-ID: <sent.Wed.May.23.16
Source record: 240619

There have been one or two postings lately about lharc incompatibilities . The main reason for this is the recently posted lharc 1.13 . Throw it away ! It wont read anything but ST and MS-DOS lharcs ... there are two reasons for this . One is a bug in the header checksum routine which works for MS-DOS but the ST version is totally brain-damaged and assumes an ST header .. if the checksum fails you get the cryptic 'No File' . Secondly even if this bug wasn't there,there is no support for '/' to '\' translation which messes things up somewhat :-) In my experience UNIX lharc will extract anything despite it having a lower version number ... A port of this to the ST is on dsrgsun. Since using that I've never had problems extracting anything . Also it doesn't suffer from the silly file limit of 1.13 , or the annoying 'sort by filename' feature .

>file through LaTeX.

My instructions in the README file were just suggestions. I think you are probably running a different version of LaTeX than the one I am running. I have my .sty files in /tex/inputs and they work fine.

A good solution would be to modify texshell to read a file of environment variables from disk when it starts up. But I haven't gotten around to it yet. Any volunteers?

I am for splitting up the group for the same reason, to be sure I didn't
miss any details of importance.

Some weeks I have an hour a day to read the group and I I will read the
postings on how to get the Super fi-uh from the mean beastie on level
5 of LGG (latest and greatest game). Other weeks I have just a few minutes
a week and don't have the time. If the groups were split up I could read
the tech group all the time and the misc group whenever I had the time.
Thats why I voted yes to the split.

| - Some files could be extracted on the ST with LHarc V1.13.
|
| - Others could not be extracted on the ST with LHarc V1.13 but with the
| extract-only tool Unlzh.
|
| - And then there was the .LZH file comprising the sources of LHarc
| V1.13. Neither
| LHarc V1.13 nor Unlzh could extract it. I finally transferred it back to our
| Sun where I was able to handle it with the Lharc installed there.
| ----------

I think the ST world may be suffering from multiple, incompatible ports
of LHarc. The latest version posted to GEnie just last week was 0.60.
It was by the same author that wrote 0.52, which seems to be quite reliable.
I think the author's name is John Webb. I've yet to come across a file
I couldn't extract with .52. The main improvements in .60 seems to be
in friendliness/cosmetics and speed.

The only oddity I've noted with version .52 is that *.SPC files actually
grow when LHarc'd - by about 10-20% !

4530. Problem with 5.25" Floppies on the STe

Newsgroup: comp.sys.atari.st
Date: 1990-05-23 23:45:05 UTC
From: chris@tharr.UUCP
Message-ID: <757@tharr.UUCP>
Source record: 240614

I have been trying to get a standard 5.25" drive to work on the STe
but I just get "Drive B is not Responding" messages the whole time.
The STe is obviously trying to access the drive as the motor spins
and the drive light comes on, but will not let me read a disk.

The same drive works fine on my Mega-4 and my very old 1040.

Does anyone have any idea what might be causing this?

Many thanks,

chris.

You might also want to consider Mark Williams C and its companion development system, the micro-shell. It sounds, from a previous article, as if OS/9 is considerably more powerful. I've never used OS/9 so I can't compare either performance, features, or price. But I do use the MWC micro-shell and like it well enough.

Your program is a clever hack, but I'd dispute the claim that it'll probably continue to work on future TOSes. As you mention in the source code, it uses undocumented variables in the basepage, which Atari may change at any time. It also relies on both the child and parent being co-resident in memory and sharing the same address space, something that may very well change if a multi-tasking TOS is ever introduced. It'll probably also break under micro RTX and similar TOS enhancements/replacements; I know for a fact that it won't work under the one I'm working on, but since I plan to add swapping I don't really care if I break programs that mess with their parents' address space!

A couple of people responding to this question have said that it can't be done by any decent means, and that if it *can* be done at all, it would be by fiddling with internal variables that move from release to release of TOS and therefore shouldn't be done.

Okay, so how do the various shell products do it?
I use Mark Williams' micro-shell; others have (in various contexts) recommended Minix, Idrix, and OS/9. How do *their* 'cd' programs work?

A related, and probably easier-answered question:
Is there an easily-obtainable, well-regarded program
that will allow me to format DSDD disks for the IBM PC on my Atari?
I gather that I don't want to do this for stuff that will truly
only ever be useful on my Atari, but (a) I often want to exchange
text and source files with IBM PC's, and (b) it would give me some
comfort if all my non-system files were backed up on disks that
something besides the ST could read, in case of catastrophic failure.

I don't know if there's a difference between plain "Meg-a-Minute"
and "Meg-a-Minute Elite", but the description of the latter in the
current issue of /CompuServe/ magazine is:

Dave Small's Meg-a-Minute Elite backup
utility source files; for exclusive use of
[CompuServe] Atari Forum members.

Maybe if we can find Dave Small, we can find out if there's a
non-elite version for non-CompuServe people. I'll try to find him.

I don't have the source code, but following is general documentation on
the encoding methods.

Data Compression Algorithms of LARC and LHarc
Haruhiko Okumura*
*The author is the sysop of the Science SIG of PV-VAN. His
address is: 12-2-404 Green Heights, 580 Nagasawa, Yokosuka 239
Japan
---

1. Introduction

In the spring of 1988, I wrote a very simple data compression program
named LZSS in C language, and uploaded it to the Science SIG (forum) of
PC-VAN, Japan's biggest personal computer network.

That program was based on Storer and Szymanski's slightly modified
version of one of Lempel and Ziv's algorithms. Despite its simplicity,
for most files its compression outperformed the archivers then widely
used.

Kazuhiko Miki rewrote my LZSS in Turbo Pascal and assembly language, and
soon made it evolve into a complete archiver, which he named LARC.

The first versions of LZSS and LARC were rather slow. So I rewrote my
LZSS using a binary tree, and so did Miki. Although LARC's encoding was
slower than the fastest archiver available, its decoding was quite fast,
and its algorithm was so simple that even self-extracting files
(compressed files plus decoder) it created were usually smaller than
non-self-extracting files from other archivers.

Soon many hobby programmers joined the archiver project at the forum. Very many suggestions were made, and LARC was revised again and again. By the summer of 1988, LARC's speed and compression have improved so much that LARC-compressed programs were beginning to be uploaded in many forums of PC-VAN and other networks.

In that summer I wrote another program, LZARI, which combined the LZSS algorithm with adaptive arithmetic compression. Although it was slower than LZSS, its compression performance was amazing.

Miki, the author of LARC, uploaded LZARI to NIFTY-Serve, another big information network in Japan. In NIFTY-Serve, Haruyasu Yoshizaki replaced LZARI's adaptive arithmetic coding with a version of adaptive Huffman coding to increase speed. Based on this algorithm, which he called LZHUF, he developed yet another archiver, LHarc.

In what follows, I will review several of these algorithms and supply simplified codes in C language.

2. Simple coding methods

Replacing several (usually 8 or 4) "space" characters by one "tab" character is a very primitive method for data compression. Another simple method is run-length coding, which encodes the message "AAABBBBAACCCC" into "3A4B2A4C", for example.

3. LZSS coding

This scheme is initiated by Ziv and Lempel [1]. A slightly modified version is described by Storer and Szymanski [2]. An implementation using a binary tree is proposed by Bell [3]. The algorithm is quite simple: Keep a ring buffer, which initially contains "space" characters only. Read several letters from the file to the buffer. Then search the buffer for the longest string that matches the letters just read, and send its length and position in the buffer.

If the buffer size is 4096 bytes, the position can be encoded in 12 bits. If we represent the match length in four bits, the <position, length> pair is two bytes long. If the longest match is no more than two characters, then we send just one character without encoding, and restart the process with the next letter. We must send one extra bit each time to tell the decoder whether we are sending a <position, length> pair or an unencoded character.

The accompanying file LZSS.C is a version of this algorithm. This implementation uses multiple binary trees to speed up the search for the longest match. All the programs in this article are written in draft-proposed ANSI C. I tested them with Turbo C 2.0.

4. LZW coding

This scheme was devised by Ziv and Lempel [4], and modified by Welch [5].

The LZW coding has been adopted by most of the existing archivers, such as ARC and PKZIP. The algorithm can be made relatively fast, and is suitable for hardware implementation as well.

The algorithm can be outlined as follows: Prepare a table that can contain several thousand items. Initially register in its 0th through 255th positions the usual 256 characters. Read several letters from the file to be encoded, and search the table for the longest match. Suppose the longest match is given by the string "ABC". Send the position of "ABC" in the table. Read the next character from the file. If it is "D", then register a new string "ABCD" in the table, and restart the process with the letter "D". If the table becomes full, discard the oldest item or, preferably, the least used.

A Pascal program for this algorithm is given in Storer's book [6].

5. Huffman coding

Classical Huffman coding is invented by Huffman [7]. A fairly readable accound is given in Sedgewick [8].

Suppose the text to be encoded is "ABABACA", with four A's, two B's, and a C. We represent this situation as follows:

```
4 2 1
| | |
A B C
```

Combine the least frequent two characters into one, resulting in the new frequency 2 + 1 = 3:

```
4 3
| / \
A B C
```

Repeat the above step until the whole characters combine into a tree:

```
7
/ \
/ 3
/ / \
A B C
```

Start at the top ("root") of this encoding tree, and travel to the character you want to encode. If you go left, send a "0"; otherwise send a "1". Thus, "A" is encoded by "0", "B" by "10", "C" by "11". Algotether, "ABABACA" will be encoded into ten bits, "0100100110".

To decode this code, the decoder must know the encoding tree, which must be sent separately.

A modification to this classical Huffman coding is the adaptive, or dynamic, Huffman coding. See, e.g., Gallager [9]. In this method, the encoder and the decoder processes the first letter of the text as if the frequency of each character in the file were one, say. After the first

letter has been processed, both parties increment the frequency of that character by one. For example, if the first letter is 'C', then freq['C'] becomes two, whereas every other frequencies are still one. Then the both parties modify the encoding tree accordingly. Then the second letter will be encoded and decoded, and so on.

6. Arithmetic coding

The original concept of arithmetic coding is proposed by P. Elias. An implementation in C language is described by Witten and others [10].

Although the Huffman coding is optimal if each character must be encoded into a fixed (integer) number of bits, arithmetic coding wins if no such restriction is made.

As an example we shall encode "AABA" using arithmetic coding. For simplicity suppose we know beforehand that the probabilities for "A" and "B" to appear in the text are 3/4 and 1/4, respectively.

Initially, consider an interval:

0 <= x < 1.

Since the first character is "A" whose probability is 3/4, we shrink the interval to the lower 3/4:

0 <= x < 3/4.

The next character is "A" again, so we take the lower 3/4:

0 <= x < 9/16.

Next comes "B" whose probability is 1/4, so we take the upper 1/4:

27/64 <= x < 9/16,

because "B" is the second element in our alphabet, {A, B}. The last character is "A" and the interval is

27/64 <= x < 135/256,

which can be written in binary notation

0.011011 <= x < 0.10000111.

Choose from this interval any number that can be represented in fewest bits, say 0.1, and send the bits to the right of "0."; in this case we send only one bit, "1". Thus we have encoded four letters into one bit! With the Huffman coding, four letters could not be encoded into less than four bits.

To decode the code "1", we just reverse the process: First, we supply the "0." to the right of the received code "1", resulting in "0.1" in binary notation, or 1/2. Since this number is in the first 3/4 of the initial interval 0 <= x < 1, the first character must be "A". Shrink the interval into the lower 3/4. In this new interval, the number 1/2

lies in the lower 3/4 part, so the second character is again "A", and so on. The number of letters in the original file must be sent separately (or a special 'EOF' character must be appended at the end of the file).

The algorithm described above requires that both the sender and receiver know the probability distribution for the characters. The adaptive version of the algorithm removes this restriction by first supposing uniform or any agreed-upon distribution of characters that approximates the true distribution, and then updating the distribution after each character is sent and received.

7. LZARI

In each step the LZSS algorithm sends either a character or a <position, length> pair. Among these, perhaps character "e" appears more frequently than "x", and a <position, length> pair of length 3 might be commoner than one of length 18, say. Thus, if we encode the more frequent in fewer bits and the less frequent in more bits, the total length of the encoded text will be diminished. This consideration suggests that we use Huffman or arithmetic coding, preferably of adaptive kind, along with LZSS.

This is easier said than done, because there are many possible <position, length> combinations. Adaptive compression must keep running statistics of frequency distribution. Too many items make statistics unreliable.

What follows is not even an approximate solution to the problem posed above, but anyway this was what I did in the summer of 1988.

I extended the character set from 256 to three-hundred or so in size, and let characters 0 through 255 be the usual 8-bit characters, whereas characters 253 + n represent that what follows is a position of string of length n, where n = 3, 4 , ... These extended set of characters will be encoded with adaptive arithmetic compression.

I also observed that longest-match strings tend to be the ones that were read relatively recently. Therefore, recent positions should be encoded into fewer bits. Since 4096 positions are too many to encode adaptively, I fixed the probability distribution of the positions "by hand." The distribution function given in the accompanying LZARI.C is rather tentative; it is not based on thorough experimentation. In retrospect, I could encode adaptively the most significant 6 bits, say, or perhaps by some more ingenious method adapt the parameters of the distribution function to the running statistics.

At any rate, the present version of LZARI treats the positions rather separately, so that the overall compression is by no means optimal. Furthermore, the string length threshold above which strings are coded into <position, length> pairs is fixed, but logically its value must change according to the length of the <position, length> pair we would get.

8. LZHUF

LZHUF, the algorithm of Haruyasu Yoshizaki's archiver LHarc, replaces LZARI's adaptive arithmetic coding with adaptive Huffman. LZHUF encodes the most significant 6 bits of the position in its 4096-byte buffer by table lookup. More recent, and hence more probable, positions are coded in less bits. On the other hand, the remaining 6 bits are sent verbatim. Because Huffman coding encodes each letter into a fixed number of bits, table lookup can be easily implemented.

Though theoretically Huffman cannot exceed arithmetic compression, the difference is very slight, and LZHUF is fairly fast.

The accompanying file LZHUF.C was written by Yoshizaki. I translated the comments into English and made a few trivial changes to make it conform to the ANSI C standard.

True for the different stack frame.
The priviliged instructions can be dealt with by a little exeption
handler.

The main problem is the price of the 010 chip: its too expensive.

"cd" is internal, not a program. (The msh command "set in .bin" will print out a list of all the internal msh commands.) msh sets the current directory according to your instructions, presumably using GEMDOS function 0x3B. Any child process that you may launch will inherit it.

All the other shells I have used also have built-in "cd" commands.

> others have (in various contexts)

Beats me. But they're not TOS anyway.

When you type 'cd /whatever' on one of those shells, you're not spawning
a child process that changes the directory of the parent process, you're only
executing an internal command of the shell. Basically, the shell modifies
its own current directory, not that of some parent process. If you give
a command to spawn another shell to one of these things (like typing 'csh'
on a unix machine) and then do a cd, you'll be somewhere else, but when you
exit the spawned shell, you SHOULD be back at the same directory you were
at when you spawned the extra shell. A spawned shell has a new environment
created for it so 'cd' or whatever, only affects the child process. On
MSDOS machines, of course, this is done totally wrong so that if you spawn
a shell and 'cd', you'll still be in the new location when you type 'exit',
but that's just because MSDOS is brain dead.

|release of TOS and therefore shouldn't be done.

It really isn't that bad as some people would like you to believe. The bad part is that a child process should not mess with its parent; since TOS does not enforce that, and since people have explicitly asked to do so (accepting to violate the above rule) there are (several) ways of doing it.

|
|Okay, so how do the various shell products do it?
|I use Mark Williams' micro-shell; others have (in various contexts)
|recommended Minix, Idrix, and OS/9. How do *their* 'cd' programs work?

Simple: cd should be a builtin command, as it must modify the shell's current drive/directory. It uses the GEMDOS calls Dsetdrv()/Dsetpath() to do so. Idem for setting of environment variables; must be a builtin. A shell that cannot handle such things isn't worth considering; if you're stuck with it, you can still consider using something like the above hack.

Leo.

4547. Plea #2 for PRO GEM parts 14 - 17 + appendices...

|> Appended is source code and a .TTP program (arced and
|> uue-ed).... [etc]
|
|Your program is a clever hack, but I'd dispute the claim that it'll probably
|continue to work on future TOSes.

Feel free to do so. Your dispute is at least as much guesswork as my
what you call 'claim' (note I used the word probably, and I certainly
didn't use the word claim myself). The use of variables in the basepage
didn't change over TOS releases (at least not that I know of); this
makes one somewhat more confident than use of release-dependent
variables. Of course Atari is free to modify the basepage layout if
they please (except for the documented ones) ...

| As you mention in the source code, it
|uses undocumented variables in the basepage, which Atari may change at any
|time.

Some undocumented variables have been used by several people: the
parent process address at bp+36 is one of them. Sometimes you have to
play these tricks to get something working under TOS (if I recall
correctly, at some time or another a recommended way was promised to do
this from TOS 1.4 on).

| It also relies on both the child and parent being co-resident in memory
|and sharing the same address space, something that may very well change if
|a multi-tasking TOS is ever introduced.

Optimist 8-).

| It'll probably also break under
|micro RTX and similar TOS enhancements/replacements; I know for a fact
|that it won't work under the one I'm working on, but since I plan to add
|swapping I don't really care if I break programs that mess with their
|parents' address space!

I'm interested to know how you plan to interface this stuff with GEMDOS
without knowledge and/or use of GEMDOS inside information. I've already
done a lot of similar things, and my experience was invariably that if
you're going to do 'system stuff' the GEMDOS outside info will offer
you little 'hooks and pointers'. You always end up reading disassembled
code. Just curious how you are going to do without.

Note that you've fallen into the pitfall yourself: TOS does not promise
that parent and child are co-resident in memory; it also doesn't promise

that they may be swapped out. Your assumption that they may could just as well break under TOS > 1.6.

About swapping: note that since the ST lacks VM, a process is pinned down to its load address (after relocations have been resolved and the program is started, there is no way to move it reliably to a different place in memory). If you swap out such a process - let's call it process A - then use (part of) its memory for another process B, you will have to swap out B before A may be read in. Imagine what happens if there is a pipe from A to B: A writes the pipe, is suspended, must be swapped out, B is swapped in, reads the pipe, is suspended, must be swapped out, A is swapped in, etc... I hope you have considered these kind of pitfalls (and if you can handle that, more power to you).

Leo.

>Okay, so how do the various shell products do it?
>I use Mark Williams' micro-shell; others have (in various contexts)
>recommended Minix, Idrix, and OS/9. How do *their* 'cd' programs work?

The "cd" command is built in to msh (the Mark Williams shell) and all of
the Unix shells. If I remember correctly, it is also built in to the
MT C-shell. This is done by the command interpreter look in a table
of built in commands before trying to find a program in the path.

To get a list of the built in shell commands recognised by msh,
type
set in .bin
at the shell prompt. The values of the variables in the list are
address offsets to which to jsr. (All built-ins have the same
argument list, and actually look very much like normal programs
except that they don't call exit().) Because the cd command
is built in to the shell, it has no trouble changing the shells
current directory.

I hope this clears some things up.

I use Moshe Braner's PD "IBMFMT". This handles both 3.5 and 5.25
inch disks, with no other options, but produces a simon-pure MS-DOS
formatted disk WITH the TOS random serial number.

TOS 1.4 is compatible by default, so upgrading your ROMs might be
all you need. I don't know where to get IBMFMT in the "real world",
though; it may be in your favorite repository somewhere.

4552. .SPC files grow when "compressed" with LHarc

Newsgroup: comp.sys.atari.st
Date: 1990-05-24 19:21:33 UTC
From: dmb@wam.umd.edu
Message-ID: <1990May24.192133.14926@wam.umd.edu>
Source record: 240642

>The only oddity I've noted with version .52 is that *.SPC files actually
>grow when LHarc'd - by about 10-20% !

Not really that surprising, since .SPC files are already compressed. When you
compress a compressed file, you're just adding this extra bit of
overhead and not getting rid of any data. (There's always a lower bound
on the amount of compression, determined by the information content.)

What's odd is that LHarc doesn't realize it's made the file bigger. Most
compressions programs will. (e.g., arc will "store", compress will fail
to produce a .Z file, etc.)

>
> Thanks all,
>
> Dave Baggett
> dmb@wam.umd.edu

I don't think there is any way to just simply upgrade from a
8Mhz clock speed to and 16Mhz clock speed without having to change
just about everything in the machine. I'm sure the factory installed
memory won't be fast enough and there is whole host of other things
that would need to change. It is possible to improve performance by
putting more into a single time frame with parallelism by adding
things like a math or graphics coprocessor; I believe the blitter chip
is a graphics coprocessor, but have never seen one in use, so I don't
know how much of a difference it makes.

I've seen math coprocessors available for the ST, but unless a
program is specifically designed to use it, it doesn't do anything.
It would help your own math oriented programs, but it wouldn't have
any effect on most commercial software.

A while ago, I heard of a company offering a RISC conversion
package for an ST. RISC machines usually are much faster, but the
entire operating system and CPU would need to be replaced, none of
the old binaries would work, and many programs would have to be
rewritten before recompiling.

My personal opinion on trying to boost the performance of an
ST is that it is not worth the expense and possible problems. The ST
is a very fast machine as it is, and I've found very few instances
where more performance is needed.

Hello, I am a current owner of an Atari eight-bit eight-hundred XL computer.

I will be soon upgrading to an ST computer within 5 months.

I am wondering what would be a good setup. Which system to buy. All that good information.

I have a budget of seven hundred and fifty dollars.

Any recommendations?

PLEASE send all information/suggestions to me via MAIL. My email address is at the top and bottom of this message.

Thank you,

[here is my address]

4561. HELP KEY ON 1MEG SPECTRE

Newsgroup: comp.sys.atari.st
Date: 1990-05-25 04:44:54 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3487@rodan.acs.syr.edu>
Source record: 240649

With v2.65 of spectre, pressing the HELP KEY while in mac mode
gives you access to a configuration menu--UNLESS YOU ARE IN
832K MODE. This is great if you're ST has more than 1meg. It
would not be all that terrible if you only have 1meg EXCEPT---
It seems that hitting the HELP KEY in the 832K mode
irreversibly freezes the machine! You have to go through
rebooting your ST and then spectre. You can't even use
shift-undo to restart mac mode.
Dave...if you are out there...can anything be done to take
care of this? It can be rough, just missing the backspace
key...

Does anyone out there have a good PD Disk defragger, or utility/program that accomplishes the same thing? If it makes any difference, I have a 80MB Quantum Pro-drive, and ICD Host adapter (I doubt that it should however).

Thanks,

Mike
or
baffoni@alcor.usc.edu
mbaffoni@skat.usc.edu

>But I do use the MWC micro-shell and like it well enough.

I don't think the MWC "msh" really is what he's looking for (Stefan is
a friend of mine). It has no multi-tasking capabilities (minix has, I
presume?), and it is not compatible with unix on a source code level.
Maybe the Gnu gcc with David B's "RTX" would do the trick.

Someone who knows where we can get hold of gcc and rtx? Are rtx
released to the public domain or is it still sold??
We do not have access to ftp.

|>In my experience UNIX lharc will extract anything despite it having a
|>lower version number ... A port of this to the ST is on dsrgsun. Since
|>using that I've never had problems extracting anything . Also it
|>doesn't suffer from the silly file limit of 1.13 , or the annoying 'sort
|>by filename' feature .

Is this common sense? If it is I would like to adopt Arcgsh to it. As I
announced here a week or so ago the new version 3.0 of Arcgsh has a
graphical interface to LHarc - but that's the LHarc version posted in
comp.binaries.atari.st and the above quoted poster suggests to "throw it away".

If you all would rather like to see Arcgsh working together with the
LHarc version on dsrgsun I could adopt Arcgsh to it (a minor task)
before releasing Arcgsh V3.0 to the world. The Arcgsh documentation
isn't ready anyway...

> I use DCFORMAT and have read other people having good results with IBMFMT (not
> sure of the spelling).
>
One thing to beware - if you choose the 'MS-DOS Bootsector' option in DC Format, be careful when using disks formatted in this way on the ST. The ST will think all the disks have the same serial number, which could lead to FAT corruption. (This applies to all disks formatted on PCs & clones too - where the ST wants to see a serial number, IBMs etc. put the DOS version number.)

DC Format WITHOUT the MS-DOS bootsector option will format the disk in a way which many PCs can read, as will NeoDesk, TOS 1.4 and no doubt many other formatters. If you really need all the MS-DOS bootsector junk, Moshe Braner's IBMFMT will put it on the disk for you AND will write a random serial number in the correct place (make sure you have version 1.1 or higher - version 1.0 left the DOS version number in.)

How do you remove and kill when you already have done a Ptermres?

> There is one minor short coming - the pack is for Borland TC only,
>but you are free to modify the source to run with your favourite C
>compiler.
> - Klaus (micro@imada.dk).

if you want a version which doesn't depend on a specific Compiler, and
you don't like Assembler (like me) try following definition.

```
typedef struct {
char xb_magic[4];
char xb_id[4];
void *xb_vec;
short xb_jmpCode; /* has to be 16-Bit. contents: 0x4EF9 */
void (*xb_newVec)();
} XBRA;

XBRA xBra =
{ 'X','B','R','A',
'_','i','d','_',
0L,
0x4EF9, /* Code for jmp */
NewFunktionName
};
```

Now you have to do only two things: Put the old Contents in xb_vec, and
write the adress of xb_jmpCode in the System-adress. Everything in Super-
visor mode of course.
I wrote my own library for install. I remove with an external tool.
This results in very small installing code, which is important for me for
resident tools.

Hi netters,

I am in need of the pinout of the internal connector on the Mega ST.
Could someone post it (or email it to me) please??? Also any peculiarities of
its use that are known would be useful.
Also, is there a 68000 ST assembler around that will produce Motorola
S-records?? I have ordinary Devpac 2, which doesn't, and would like something
like asm68 on the PC (only preferably about 2^32 times faster...)

Thanks in advance,

>here.

Have you seen the hypercache upgrade board? I know it's expensive but
it's good (I don't know whether it's 200 pounds good however) IT's got
a 16K (or is it 8) data cache to give it some speed. It also has a slot
for a 68881 and slots for the TOS1.4 roms so that ROM routines will be
run at full speed. They're meant to be bringing out a 68030 hypercache
soon, but I don't know much about that one.
I was toying with the idea of buying a hypercache to speed minix up
a little, but I don't think it's worth it. Maybe I'll just buy a
33Mhz 386 and be done with it :-) (Running Xenix of course)

But there is some problem on the Atari side. After
using the dc format to write ms-dos boot sectors, the GEM file selectors
often cannot recognize the directory of the disk correctly. (It shows garbge).
But from the desktop everything works fine. (Copying and deleting
files work ok) In program like First Word which makes use of the
file selector it doesn't display the directory
correctly and access to some files become impossible.
Does anyone know why? (This happens in a 520st with tos 1.0).

4574. Gemini & Emacs

Newsgroup: comp.sys.atari.st
Date: 1990-05-25 18:40:06 UTC
From: bills@mcrware.UUCP
Message-ID: <1661@mcrware.UUCP>
Source record: 240663

I've been playing with Gemini (English version), looks great so far, although it seems to take about 260K of memory when I execute other programs from it.

When I run emacs V3.10 from the console window and then shell out of emacs I get four bombs, a return to Gemini, and bizarre behavior until I coldboot. I've noticed the the environment variable for $SHELL is mupfel.prg. Is emacs trying to shell to mupfel.prg, but can't since there is no program by that name when using the integrated Gemini? Is it possible to shell from emacs back to the console window/mupfel?

Bill Sheppard

4575. Gemini memory usage

Newsgroup: comp.sys.atari.st

4576. sozobon C bug in puts,printf...

Newsgroup: comp.sys.atari.st
Date: 1990-05-25 19:30:42 UTC
From: gossa@rdge44.enet.dec.com
Message-ID: <11959@shlump.nac.dec.com>
Source record: 240654

Can someone help me, I seem to have come across a bug in DLIBS 1.2
in the terminal printing functions:

puts()
printf()

They don't seem able to handle strings of length > 256 chars.

value = puts("<string of > 256 chrs>");

after executing this value = 257 and only the first 256 chars have
been printed.
Inspection of the .s files shows that HCC is generating correct code
so the problem must lie in the DLIB puts() and printf() routines.

>
>I was able to run SUNCLOCK on my 1 meg 520 TOS 1.0 _color_ system, using the
>Monoware monochrome emulator.

I got it running on my ST2. No problem at all.

My only complaint is that the screen is 6 hours out of sync
with the sun itself. That is because the program is set to
agree with the sun if you have the clock on your ST set to
Middle European Time.

Joep Mathijssen, the porter, (good work Joep) is sitting
one fourth of the way around the world from me.

I would love to see the sun come up (or set) just as the edge of
the shadow moves past thej place on the map where I sit. (*)
I think that there needs to be a way to set an "offset" on the
sunclock. The offset needs to be in hours and minutes, cause
not all time zones are one hour apart.

(They say that when you land in Newfoundland, you
set your watch back by half an hour and 50 years.)

(*) Where does the archive site "terminator" get its name?

4579. IDRIS (Was: Does anybody no anything about UNIX on an Atari ST)

This is just to report that I have had no responses from anyone
who has had their hands on IDRIS. If there were any IDRIS
buyers, they seem not to be on the net now. What a pity.
I had the impression at the time that IDRIS was ahead of
its time.

Someone wrote and asked the address for Whitesmiths.
I do not have it.

I had an evaluation copy of IDRIS back in the fall of '87, it was the full up developers version with the C & Pascal compilers also. I didn't really do much with it as I did not win the contract that I had proposed using the ST with IDRIS.

Whitesmith did not do the port for the ST, it was done by a company in the Seattle area called Computer Tools International. At one of the Comdex's many years ago Atari made lots of fan fair on how IDRIS was going to be the official UNIX-type OS for the ST AND then they promptly dropped it.

X-windows Rev. 10 was also ported to IDRIS by Computer Tools. This all I can remember as this is close to a 2.5 year memory.

puts() and printf() are not at fault.

Note the following demonstration program and the generated code. The
LONGSTRING data in the C file contains 361 bytes (including \0); L3 in the
assembly output stops at 256 and then appends $0. The the 256-byte limit
for string literals lies in hcc. I was a beta tester and knew about it in
1988. I assumed a caveat had made its way into the docs ... but I just
checked and sure enough, it didn't.

#include <stdio.h>
#define LONGSTRING \

4582. Gnu SmallTalk V1.1 for the AtariSt now available

Newsgroup: comp.sys.atari.st
Date: 1990-05-26 08:38:50 UTC
From: bammi@curie.ces.cwru.edu
Message-ID: <BAMMI.90May26043850@curie.ces.cwru.edu>
Source record: 240676

the new version of Gnu SmallTalk (V1.1) for the atariSt is now available from dsrgsun.ces.cwru.edu or picasso.ces.cwru.edu via anonymous FTP, in pub/atari/smalltalk1-1.zoo. the archive includes complete sources, executable and a kernel image. to use it you need a St with 4Megs of memory (it will *not* run on a 2/2.5Meg machine). to re-compile it, you'll need gcc v1.37.1, also available from the above site.

enjoy,

4583. How is Atari doing in Europe?

Newsgroup: comp.sys.atari.st
Date: 1990-05-26 14:01:51 UTC
From: kacovert@miavx1.acs.muohio.edu
Message-ID: <1446.265e45ff@miavx1.acs.muohio.edu>
Source record: 240677

Does anyone have any information (actual figures please) concerning the sales of Atari Corp in Europe compared to other computer companies in Europe (such as IBM, Apple, Commodore, etc.)? I have heard stories that Atari is doing incredibly well in Europe, but I would like to have some facts to back that up.

Thanx in advance,

Kent Covert
Miami Univerity
Oxford, Ohio

(Miami's in Ohio, Dammit!)

4584. Re: OO-GEM Proposal and Smalltalk-80 question

Newsgroup: comp.sys.atari.st
Date: 1990-05-26 15:33:13 UTC
From: schiers@mcshh.hanse.de
Message-ID: <7539@mcshh.hanse.de>
Source record: 240684

bhodges@blackbird.afit.af.mil (Bill Hodges) writes:
>I have seen several articles on Smalltalk-80 and because of a growing
>interest in object oriented things (OOP, OOA, etc.) I am interested
>in buying it. However, I called Parc Place in California and they
>don't know of a version for the ST. I am interested in any OO language
>that has a stable version for the ST. Any suggestions?

Since g++ isn't stable, you should ask ParcPlace again. I have their
original Smalltalk-80 Version 2.3 Rel. 4 from 1988. The address is
written on the six disks labels:

ParcPlace Systems, Inc.,
1550 Plymouth Str.,
Mountain View,
CA 94043,
U.S.A.

I've got it from my German distributor Georg Heeg at Dortmund. It is stable
and full compatible to all other Parcplace implementation, even the images
are shareable.

CU Carsten.

I dl'ed a utility called ps2form from comp.binaries.atari.st several months
ago. It works much more reliably than anything else I have tried. It should
be on terminator or some such.

4587. Tech Specialties upgrade board

Newsgroup: comp.sys.atari.st
Date: 1990-05-26 19:51:35 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3501@rodan.acs.syr.edu>
Source record: 240679

I know this general topic has been covered many times before, so I thought I'd ask in a more specialized way. I'm interested in hearing from anyone who has used a Tech Specialties board to add memory to a 520ST...not FM, but not the first run either...i.e. the one that has an RF modulator in it AND a reset button on the back. If anyone has used this board to upgrade memory to such a machine, I would appreciate finding out how your experience was: from dealing with the company to putting in the board and after. Email to me at the addresses below (the bitnet machine is more reliable).
Thanks,
Gerry

I thought the catalog from the company was impressive. After making such
a statement here however, many netters posted bad experiences with this
company. I decided to not buy any of their stuff, just to be safe (nothing
is worse than being screwed through the mail).

[]
Where can I get some TOS chips of any sort other than 1.0?

I want to upgrade my ancient 1040ST, and I don't want to have to
pay extra to have a dealer put them in for me...

Pointers would be greatly appreciated. I'm getting frustrated
seeing all these neat programs that'll only run with 1.2 or above...

There are also stories that Atari's onetime lead in the European market is beginning to slip... I too would like to hear some factual reports from "real people" in Europe...

Today, Michael Schutz, one of the editors of Germany's "PD Magazine" stopped by the headquarters of AIM Magazine for a visit on his trip around the USA, and mentioned that TommySoft, one of their biggest software manufacturers has dropped their entire line of Atari software..

He wasn't familiar with the term "Another one bites the dust", but he understood the concept...

4593. Illegal Editing, Tampering of ST Report by Greg Lindahl

Newsgroup: comp.sys.atari.st
Date: 1990-05-28 00:05:09 UTC
From: MICHAEL_ARTHUR@bdt.UUCP
Message-ID: <2824@bdt.UUCP>
Source record: 240691

Ralph Mariano, and the staff of ST Report have recently obtained evidence th Greg Lindahl, who sends issues of ST Report and ZMag by E-Mail to several people on UseNet, has engaged in illegal activities concerning ST Report.

Specifically, there is evidence of Greg Lindahl's having deleted large segments of ST Report, changed its content to suit his tastes, and added some of his own information to the issues of ST Report which he later E-Mailed to other people on Usenet.

Since ST Report is a copyrighted publication, and such editing is illegal, Ralph Mariano wishes to express his sentiments that if Greg Lindahl is indeed doing such a thing, that he stop immediately, because such actions would incriminate both Greg Lindahl and other sources which he uses in the course of perpretrating such acts.

Having been asked to post this message by Ralph Mariano (Publisher of ST Report), I also relay his request for dialogue with him on this matter....

4594. Compressing animation pics (ray trace .PI1 format)

Newsgroup: comp.sys.atari.st
Date: 1990-05-28 01:26:06 UTC
From: jvance@bonnie.ics.uci.edu
Message-ID: <26607E2E.19429@paris.ics.uci.edu>
Source record: 240687

I've been playing around with the pearl raytracer from terminator.
It produces some nice looking ray traced animation but now I have
over two meg of .PI1 pics.
I'm sure these can be compressed, but what I want to know is if there
is a PD or shareware or commercial program that will compress the pictures
and put them into one of the many animation file formats. I'd rather
have one 500k file than 25 30k files.

I have the same problem with Mark Williams msh as well.

I solved the problem by going back to 3.9e. This one works.

>"real people" in Europe...

True.

The ST and Mega line tend to loose against the Mac (an Mac SE, 1/20
sells for DM 2700 under "student discount" and a Mega 2 with Atari or
third party harddisk is a bit more expensive).

Used Mac II and Mac IIx appear around DM 5000 to 8000 with 2MB/40MB.
Since the long ago promised TT still fails to show up, it will have to
be extraordinary cheap (rumor says, it will sell for DM 6500 with
monochrome monitor ans 30 MB HD; this is to much to compete with a SE30,
I think), if it finally arrives.

the ST line is loosing ground against everything that can be easily
expanded like the Amiga 2000 (some cards are actually availeble :-) or
386SX PClones (386SX machines with 1MB/20MB and VGA color monitor start
at DM 3000...)

Most software manufacturers here in Germany have plans for migrating
to other computers; in the moment, they are waiting and hoping for
a production line TT that comes up to their expectations. The TTs
that ATARI gives to selected developpers now are rather disappointing
(personal opinion).

This doesn't mean that all those German software manufacturers will drop
their ST line completely; but they are preparing for other markets.

I think I've read some figures like "8 percent of all PC sales in Europe
are STs", and Commo sold approx the same here. I don't know how reliable
this information is, and whether "8 percent" means 8 percent of all
computers sold or just 8 percent of the total cashflow.

>Report), I also relay his request for dialogue with him on this matter....

Well, it is no secret that Greg and I disagree on quite a few issues, but
I think he is justified in his activities. Namely, he edits out all the
advertisements and dead wood from the report. Not only do I appreciate
this personally (it saves me from paging through all the crap), but it
also saves the net money. Why should the net be paying to distribute
10K of advertisements each week? Also, whenever Greg adds anything
to the Report, he always puts it in brackets and clearly states that
the contents is his opinion, not that of the author.

All this is silly anyway. As far as journalistic qualtiy goes, ST
Report is plain trashy. It is often inaccurate, the author frequently
shows his personal bias in reviews, and the advertisements are
a bit much. That is why I unsubscribed from it months ago. I can't
justify using 80K of disk space each week to hold that shabby
magazine.

Your mileage may vary...

Chris

Hehe, don't hold your breath waiting for Atari stock to move. The
market is exceptionally bullish (OTC market, that is) and ATC has
just kinda sat there watching the world go by. I was expecting a
teeny weeny bit of movement after it was announce that Atari was
working on a deal to trade computers for 256K DRAMS (chuckle) with
the USSR. It didn't budge. This is bad for Atari, as the stock
market has effectively been closed to them as a source of raising
fresh capital. Issuing new stock or splitting the shares outstanding
would only worsen their capitalization situation. It would drive
the value of ATC stock even lower, thus severely limiting the amount
of capital generated.

You'd be better off buying SOFTWARE TOOLWORKS (OTC), RASTER
DEVICES (OTC) or SUN MICROSYSTEMS (OTC) if you're really
interested in making cash at this point in the market.

Anyway, this is going to piss off the net.purists who demand
that only C code and debugging information be posted on the
net. :-) To them I apologize (nah). Please followup using
email.

For some time, Greg has relayed ST Report to a mailing list as a volunteer effort, without any personal gain, as a favor to people who wanted to read it. What have you done for the benefit of the network? You have issued threats.

You are not only threatening Greg.

You also are threatening the NSF Internet, its associated networks, and all the individual UUCP sites through which ST Report might be transmitted. How else am I to interpret it?

Thanks a lot for doing your bit for unity, harmony and gracious behavior.

> Having been asked to post this message by Ralph Mariano (Publisher of ST
> Report), I also relay his request for dialogue with him on this matter....

You can relay this to him: (|) (South view, equine mammal.)
l l

And you can tell him that ST Report will no longer be relayed through my system, edited or not.

My apologies to the downstream sites. Znet will continue to be available.

4605. Branch Always breakup!!!

Newsgroup: comp.sys.atari.st
Date: 1990-05-28 18:10:15 UTC
From: ignac@electro.UUCP
Message-ID: <1839@electro.UUCP>
Source record: 240520

well folks, as of 1:15 pm today (Monday May 28, 1990), I, Ignac A. Kolenko, have left Branch Always Software. The parting was an amicable one, and is due to the following reasons:

1 - too much spare time invested, with not enough return on investment (the PACE show was an excellent example of time wasted ... also, i have a full time job at Electrohome Inc, in Kitchener, Ont, and after an 8 hour day, i just DON'T feel like touching a computer in my spare time unless it's REALLY worth my while)

2 - at first it was fun, now it's just become a pain in the butt, quite frankly. my girlfriend, family and close friends are worth more of my time than my atari.

3 - i'm going off to Europe for 3 months in August, so i wouldn't be able to do anything for the company at that time anyways.

This note DOES NOT imply that Branch Always is going under. Not in the slightest. My partner, Darek Mihocka, will be continuing with the company, running it as a sole proprietorship, with myself being paid royalties for Quick Tools sales (since i authored most of the tools). Quick ST II and the Quick Tools WILL CONTINUE TO BE SUPPORTED as fully as possible, except people will have to bother Darek instead of me from now on with orders, questions, bugs, etc. An announcement on a new address, phone numbers, etc should be posted within a week or so.

I still FULLY support the Atari world in all respects, but my priorities have changed over the last few months. My job at Electrohome is very rewarding, and i don't really need the extra income from Branch Always, since i don't feel like investing the extra time anymore. BUT, while in Europe, i plan to visit Germany to see the really exceptional development that is going on over there for the atari, as well as trying my luck as a salesman for Branch Always Software (crack the German market) (i've always wanted to try marketing!!!)

so, to make a long story short, I thank everyone on the net for their help and support over the last year i've been involved with Branch Always in all the questions i've asked, and i especially thank all those loyal Atarians who have supported our venture. Just keep it up (who knows, Darek may yet become a millionaire off of the Atari!)

too-de-loo!

>that would need to change. It is possible to improve performance by
>putting more into a single time frame with parallelism by adding
>things like a math or graphics coprocessor;
It MAKES a difference using a 16MHz Card!
Most of the 16MHz(at least all cards that I know) use a cache between 8
and 16KB of static rams. That makes the perfomance grow up, because the
CPU needs no or less "slow-downs" for the internal (slow)-ram.

[...]
>I believe the blitter chip
>is a graphics coprocessor, but have never seen one in use, so I don't
>know how much of a difference it makes.

I've heard it makes a big difference if you use a colour monitor.
I can't realize a big difference between using the blitter or working without
it - I use a SM124.

>My personal opinion on trying to boost the performance of an
>ST is that it is not worth the expense and possible problems. The ST
>is a very fast machine as it is, and I've found very few instances
>where more performance is needed.

"I've" is the word that matters. Everybody has to decide on his own how
much performance he needs.
If you want to calculate the whole day fractals then of course you REALLY
need a coprocessor. :-)

cu,
Matthias

4607. v_opnwk() and v_opnvwk()

Newsgroup: comp.sys.atari.st
Date: 1990-05-28 21:14:03 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <2661949C.29268@maccs.dcss.mcmaster.ca>
Source record: 240698

I'm trying to do some GEM programming and I'm having a few problems.
Does anyone else have any experience they can share in doing this?

Specifically, I'm trying to write metafiles. The problems I'm
coming across involves v_opnwk(), v_clswk(), v_opnvwk(), and v_clsvwk().
Of course I assign workin_in[0] = 31 for metafiles.

This is what happens. When I compile and run the program with
v_opnvwk(), the handle comes back zero and it crashes when I try to call
v_clsvwk(). When I instead use v_opnwk(), it writes a 68 byte file to disk
called GEMFILE.GEM and then crashes. I get 2 bombs and it does not come
back from that command.

ABACUS GEM Programmer's Reference mentions that v_opnwk() does not
work on the ST and tends to crash. Is there a reason for this, or is it a
case of I don't know what I'm doing?

Thanks for any help.

And I would like to publically thank him for doing so.

>Since ST Report is a copyrighted publication, and such editing is illegal,
>Ralph Mariano wishes to express his sentiments that if Greg Lindahl is indeed
>doing such a thing, that he stop immediately, because such actions would
>incriminate both Greg Lindahl and other sources which he uses in the course of
>perpretrating such acts.

I guess there is a difference between editing a complete copy vs.
receiving an already edited version-- but I only read the the mags to
see if there is and good news, or if there are any new products. I an
understand that advertising helps pay bills [whatever they might
be...] but I don't see why having the SAME advertisements week after
week is necessary.

I find that before Greg edited the duplicate articles out of the
magazines that it was really a pain to try to decipher any of them
since they often had similar articles (perhaps not even in concurrent
issues) and the articles were sometimes slightly altered enough to
confuse the reader as to what was the truth.

If copyrights are indeed going to be ``inflicted'' upon us here...
I would like to say that I would rather NOT RECEIVE the magazine[s]

4609. Re: Illegal Editing, Tampering of ST Report by Greg Lindahl

Newsgroup: comp.sys.atari.st
Date: 1990-05-29 00:38:39 UTC
From: bammi@curie.ces.cwru.edu
Message-ID: <BAMMI.90May28203839@curie.ces.cwru.edu>
Source record: 240501

i personally think that greg lindahl does a great job with ST report
and Zmag. the segments he deletes are either commercial in nature, or
repeated in Zmag (or vice versa), or most importantly contain mindless
drivel (like the cpu report for instance). i am personally very glad
that he does, and i am sure it saves a lot of bandwidth. also, i get
quite a kick out of his comments (they are clearly marked as such),
they are for most part very appropriate (especially the ones
concerning the shifting moods of the editor :-).

In article <102502@convex.convex.com>, rosenkra@convex1.convex.com (William Rosencranz) writes:

> look: can we please stop using lharc until it works EVERYWHERE?

I can't argue with this.

> zoo is THE standard in the PC world

But (a) I'm not sure I see the relevance of a fact about the PC world with regard to the ST world, unless you mean it in the pre-IBM sense of "any personally-owned computer"; and (b) I can't agree with the statement using the latter interpretation, except for:

> (at least on the net).

I only just started reading netnews again (after a few years absence), a few weeks ago, and only this newsgroup, and only here have I heard of 'zoo'. I have know about and used uu*code on the net for years, and have been using plain old ARC between my Atari and this-here Unix box, between my Atari and BIX and CompuServe, and with friends who also have Ataris.

This is not to say that we should not advance the art.
If zoo is better than ARC and/or uu*code, I'd like to get it and use it, although I cringe (well, wince anyway) at the thought of keeping and using *three* such programs instead of a mere (haha) two.

By the same token, though, I would *really* cringe at having to keep and use *four* different such packages -- that is, including LHARC -- especially if the latter doesn't work.

I suppose it would be too much to hope that LHARC format will have some sort of 'format version' field, so that the program can detect which version wrote a given file -- ARC, LHARC, or some future version -- and read it accordingly.

CompuServe has a genealogy 'SIG', and has half a dozen or more genalogy programs that run on the ST. I have downloaded one package, but I haven't played with it enough to say how good it is. I'm not that familiar with genealogical terminology and conventions, and I think that accounts for some difficulties I've been having with it. Your friend might be in a better position to try them for himself than for me to download them all and try them out and try to evaluate them.

No, I'm not a CIS salesman or stockholder, I'm just sharing info

When I turn off my ST, it forgets the time. Most annoying.
A friend of mine tells me he has a thing that plugs into the cartridge
port on the left-hand side that prevents this. It is called
"TimeKeeper", and he got it from Navarone Industries, Inc.,
21109 Longeway Rd., Suite C, Sonora, CA, 95370, 209.533.8349.
I called that number and got a recording saying that it had been
disconnected. I called information and asked for their number,
and they could find no listing.

Does anyone know if Navarone Industries still exists,
and, if so, where?

If not, does anyone else still sell this device?

Can anyone recommend a different device, still available,
that would do the job?

My friend tells me that it isn't actually a clock chip,
but rather that it prevents the CPU from shutting down completely
when your turn it off with the switch.
Sounds like this might prevent a cold boot from having the desired
effect. On the other hand, maybe it only keeps a *clock* chip
from shutting down. Anyone have any better knowledge of this?

>I think he is justified in his activities. Namely, he edits out all the
>advertisements and dead wood from the report. Not only do I appreciate
>this personally (it saves me from paging through all the crap), but it
>also saves the net money. Why should the net be paying to distribute
>10K of advertisements each week?

Why? Because ST Report is a copyrighted work, and those advertisements
are part of that work. If you don't like distributing the magazine with the
ads either 1) ask the author for permission or 2) don't distribute the magazine
.

Why? To do otherwise is illegal and unethical.

>ST Report is plain trashy. It is often inaccurate, the author frequently
>shows his personal bias in reviews, and the advertisements are
>a bit much.

Doesn't justify illegal distribution.

> That is why I unsubscribed from it months ago. I can't
>justify using 80K of disk space each week to hold that shabby
>magazine.

That is the proper response.

In article <2199@laura.UUCP>, I wrote:
|>If you all would rather like to see Arcgsh working together with the
|>LHarc version on dsrgsun I could adopt Arcgsh to it (a minor task)
|>before releasing Arcgsh V3.0 to the world. The Arcgsh documentation
|>isn't ready anyway...

I have got some replies to my posting quoted above suggesting to support the LHarc version on dsrgsun with Arcgsh. I haven't got any reply that where against it. So yesterday I did the neccessary modifications to Arcgsh. I did not test LHarc extensively but the basic features seem to work.

Someone suggested I should send the dsrgsun-LHarc to Steven Grimm to get it posted to comp.binaries.atari.st. However, I think someone over there in America should do that. The reason is simple: transatlantic mail is a little expensive.

The Arcgsh documentation is nearly complete. So Arcgsh V3.0 will leave Dortmund in the next days to show up in comp.binaries.atari.st really soon now.

4621. The TT isn't late!

Newsgroup: comp.sys.atari.st
Date: 1990-05-29 13:49:56 UTC
From: kacovert@miavx1.acs.muohio.edu
Message-ID: <1462.266237b4@miavx1.acs.muohio.edu>
Source record: 240514

Cut Atari some slack about the TT!!!!

Sure, the TT isn't out yet. But neither is the Mac '030 line, really. Sure, the machine's out. But the OS isn't. The OS that's running on the Mac's currently doesn't use any of the features of the 030. The first OS that will take advantage of these features won't be released until this fall - about the same time the TT is going to be released.

Sure the Amiga 3000 is out with an 030 and I believe they have a true 030 OS with it. But I don't know of anywhere that the common user can buy one yet. They're just not available yet.

So, you might be asking, why hasn't Atari released the TT like everyone else and then finished the OS later (just like Mac did). The reason is simple. Atari's philosophy is to put the OS in ROM, not to load it in off of disk. This architecture has some real advantages which I won't discuss here. Anyway, this causes the small problem that the OS must be finished before they can release the machine, because replacing the ROM chips for all users is both a pain and infeasible.

So, my point is, when you get down to it, everyone's 030 machines are going to be coming out at approximately the same time. Just give Atari a chance.

4623. Phantom(s) and First Word Plus

Newsgroup: comp.sys.atari.st
Date: 1990-05-29 14:16:55 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <2769@syma.sussex.ac.uk>
Source record: 240516

Bob Bright's recent posting on the two phantoms was extremely useful. First Word Plus users may be interested to know that I've copied it to Simon Jones of GST Software Products. They're just about to return to work on improving/enhancing FWP for the ST.

Just to recap on FWP's relation to the bugs - version 2.02 (UK) used to be hit by both the phantom repeater (3 characters repeating across the current text line followed by bombs) and the phantom slowdown (keyboard input and mouse clicks taking an age to be acted upon - Bob's message gave some useful specifics on this).

Version 3.14 (UK), the current version, no longer seems to be affected in the same way by either. (Has anyone with v3.14 or equivalents in other countries seen them?) Instead, at unpredictable times, though always during keyboard input rather than mouse operations, FWP 'freezes' - i.e. stops accepting either keyboard or mouse input. If you want to carry on writing, you have to reset, and you lose all your work since the last save operation. Things like screensavers and the alt/help screen dump routine continue to operate (the latter is interesting given Bob's surmise that the phantoms involve keyboard input not getting through to GEM) but there's no way to continue word processing or get back to the desktop or wherever you came from. (I don't know if program switcher like Revolver, twist, Juggler or K-Switch would let you get out - does anyone have experience of this?)

I think this is a displacement of one of the old bugs. It may or may not have something to do with changes in the way FWP3 deals with keyboard input. FWP3 introduced keyboard alternatives for most mouse operations, and the program now takes over the keyboard more comprehensively than the old version used to. (A side effect of this is that Simon Poole's KEYEDIT program no longer works with FWP3. I used to use it with FWP2 to assign foreign language characters to the numeric keypad.)

If anyone has any more comments on bugs in FWP3, I'd be willing to relay them to the authors (assuming the message I just sent gets through OK). Or you could try mailing direct: the address I used is sproducts%cix.uucp@ukc.ac.uk - your route may be a little different. Please don't mail general questions about First Word Plus or other GST/Timeworks products - Simon Jones is a programmer rather than a sales or marketing person. I think he'd quite like to get bug reports, but please be as specific as possible.

Graham

What "features" are you referring to, aside from 32-bit addressing? And I
trust you're not suggesting there's no advantage to running XYZ software on
a 16-40MHz '030 versus a vanilla 8-16MHz 68000?

>Sure the Amiga 3000 is out with an 030 and I believe they have a true 030 OS
>with it. But I don't know of anywhere that the common user can buy one yet.
>They're just not available yet.

Shipping date for the A3000 is said to be July. A3000 demo units are on
display now at your nearest Commodore dealer. Based on past history,
especially recent past history, I tend to believe Commodore when they say
"available on X date". More than I believe Atari, which has had the TT
"pending" for a couple of years now. (Longer than that, if you count
the years when it was going to be an '020-based machine.) In the meantime,
you're quite able to buy an A2000 or A2500 (68000-based) and an '020 or
'030 card, which are not hacks requiring you to unsolder this & cut that
& bend there, and which are available from Commodore themselves or 3rd
party vendors.

>So, my point is, when you get down to it, everyone's 030 machines are going
>to be coming out at approximately the same time. Just give Atari a chance.

Clearly, here's a man who's suffering from early morning caffeine-deprivation
syndrome. Are you also a Cubs fan, by any chance? :-)

Gee, must be getting close to summer again...

Message-ID: <12593596115017@osu-20.ircc.ohio-state.edu>
Source record: 240522

I am totally stuck on level 5 of Dungeon Master ST. Please e-mail me
the solution to the following 'kabuki-dance/puzzle':

```
+-----+-----+ |
| === === |
| === === |
+ |
| BBB PPP |
| BBB PPP |
+Gate-+-----+ |
| | | === |
| | | === |
| Key | +-----+
| |
+-----+
```

The '=' signs are floor switches the 'B's is a blue light area
and the P's are a Pit.
There is a switch on the 'left wall' by the gate which turns on/off
the blue light and a button in the alcove which closes the pit. The blue
light area transports you to the alcove.

Hopefully this description is enough to identify where I am stuck.

Any help would be appreciated.

Thanks

Tyler

I have heard vague rumors of a PD defragger, but I have and use
Michtron's Hard Disk ToolKit. It needs to be updated, as it has some bugs
that let you harm your drive (*always* quit immediately after
defragging, the program will cause the necessary reboot) and has the
usual terrible Michtron manual, but it does do a nice job of
defragging 16Meg or less partitions (*not* my new 32Meg TOS 1.4
partition 8-( ). I haven't used the backup portion of the program, as
I read a review that said it wasn't the most secure backup program
around and because it uses the archive bit in reverse, since the programmer
claims that the old TOSes used it that way. NeoDesk and/or TOS 1.4
correct this. Anyone know if an update is out since last year? It
really needs only very minor work to be world class stuff.

>the same time the TT is going to be released.

The difference is: The Amiga OS has been 020-compatible since V1.0, if not
030-compatible. The same holds true for the Mac OS which has been 020/030-
compatible for a long time. TOS, however, has had to be adapted to the 68030
because of its short-sighted design in previous versions. Moreover, we have
heard about the TT since 1988; and it has been announced to appear RSN
since early 1989. In contrast, Commodore didn't announce anything about
the Amiga3000 until now; even at the CeBIT 1990, they didn't tell the
press anything about it. One month later, the machine simply was THERE.

4632. I have a dream ....

Newsgroup: comp.sys.atari.st
Date: 1990-05-29 20:30:20 UTC
From: wwm@pmsmam.uucp
Message-ID: <1990May29.203020.28441@pmsmam.uucp>
Source record: 240526

I have a recurring dream (some might call it a nightmare):

Dave Small manufactures a new motherboard/box for the Atari with a 25-Mhz 68030, an EISA bus (that actually WORKS with cheap, available PC interface/ memory boards), at least 2 serial ports (one with 8530 controller for Ham Packet), full, REAL SCSI, capable of booting a UNIX (or look-alike) OS that runs TOS as a GUEST process so most, if not all, of my software collection is still usable. Plus X11R4, 16 MB RAM capacity, Spectre GCR built in (or available as a simple plug-in option).

Sigh, It can't happen, can it? Someone like Dave (or some other happy hardware hacker) couldn't possibly put together such a system, could they? They couldn't possibly keep the cost competitive with a 386SX PC-Clone, could they?

Ah, it's only a dream like the other one where the enraged ST community stages an LBO of Atari and ....

t> ake advantage of these features won't be released until this fall - about
th> e same time the TT is going to be released.

Now, there is a novel idea:
Never use something at all unless you can use it completely.

But let us be really optimistic and say that the TT will be released this year.
Do you think that there is more than one chance in a trillion that it will
have a version of TOS which supports multitasking and virtual memory?

You can't be serious.

Thanasis

PS There is Unix for the Mac/30s which can also run multiple MACOSs in windows.

4637. Emacs and Gemini

Newsgroup: comp.sys.atari.st
Date: 1990-05-30 03:35:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <b452d8f9543926635b84@canremote.uucp>
Source record: 240531

The newest version of Emacs (3.10, I think) is at best a mixed blessing. It supports the mouse, but as a result, it will not run in a Gemini window, it will not run in Beckemeyer's VSH, it blanks out lower-priority tasks in Beckmeyer's MT C-Shell because it is waiting for mouse input instead of just calling GEMDOS for keystrokes, and it is just generally a bad neighbour. People writing TOS editors:

PLEEEEEEAAAAAASE use only GEMDOS and BIOS text functions and the VT 52 emulator to implement your editors. There are so few which don't screw around one way or the other. What's the point for a millisecond of scrolling speed, when it doesn't work with anything?

In article <1462.266237b4@miavx1.acs.muohio.edu> kacovert@miavx1.acs.muohio.edu writes:
>Cut Atari some slack about the TT!!!!
I agree in some ways; though I agree that it is well and firmly late,
it won't do any good to whine about it, plus, this might mean that they're
planning on releasing it:
1) When it's damn well ready, and
2) Not one minute before.
Better late than buggy.
>Sure the Amiga 3000 is out with an 030 and I believe they have a true 030 OS
>with it. But I don't know of anywhere that the common user can buy one yet.
>They're just not available yet.
The Amiga 2500/30 (the first Amiga with a 68030) has been out and
commonly available for many months. All versions of AmigaDOS will utilize
the capabilities of the 68030 (with the exception of the "calculator"
programme in ye old version 1.1. It would blow up. Some people's
kids... :-))
What you're talking about is AmigaDOS V2.0, which revamps the look
of Workbench dramatically and adds a whole list of goodies that nobody
on this list could possibly care less about. :-)
>So, you might be asking, why hasn't Atari released the TT like everyone else
>and then finished the OS later (just like Mac did). The reason is simple.
>Atari's philosophy is to put the OS in ROM, not to load it in off of disk.
Most of the Apple and Amiga operating systems are also in ROM.
>This architecture has some real advantages which I won't discuss here. Anyway,
>this causes the small problem that the OS must be finished before they can
>release the machine, because replacing the ROM chips for all users is both
>a pain and infeasible.
Actually, it's neither, as long as you socket the silly things. It's
really rather quick and easy - and certainly simpler than reformating and
reinstalling one's hard drive, as SOME people's changes in operating system
have more or less required (we don't need to mention any companies now, do
we? Even if their initials start with I or M....) :-)

The sources for a unix lharc is available on xanth.cs.odu.edu,
and it is compatible to the amiga lharc. I am not familiar with ST
Lharc, sorry.

Anyway, you can get the file lzhuf.c from that archive, which contains
the compression method (compatible with all lharc implementations.)
It is compilable by itself on unix using GCC, and it creates a
stand-alone compressor, like COMPRESS(1).

From: logic@wet.UUCP
Message-ID: <1243@wet.UUCP>
Source record: 240541
Cross-posted to: comp.sys.atari.st,alt.tv.simpsons

Recently picked up a sound digitizer for the ST and went nuts digitizing Simpson sounds. (I have two episodes on tape and squeezed ~5 MB of sound out of it)

Now I'm looking for a way to move them onto other platforms. Most of the sounds are sampled at 20khz. They are compatible with the Macintosh in a way. Most Mac sounds are sampled at either 11khz or 22khz so 20khz samples tend to sound funny. Is there a program out there which will insert false samples into a file so that it kicks up the effective sample rate?

4648. DTP and PostScript fonts and output

Newsgroup: comp.sys.atari.st
Date: 1990-05-30 11:29:53 UTC
From: johnr@praxis.co.uk
Message-ID: <5102@newton.praxis.co.uk>
Source record: 240542

I would like to get a DTP package with the following attributes:

1. Usable for "professional" quality layout and articles.

2. A good selection of fonts covering at least 8 to 32 point size.

3. I have PostScript descriptions of a chess font and macros for producing chess diagrams. I want to be able to use these as the basis for creating new fonts for the DTP package; so there must be a font editor capable of taking PostScript input.

4. Capable of producing reasonable output on a dot-matrix printer, but also able to produce PostScript output in a file for transfer to another system.

Any suggestions? Please mail me and I will summarize to the net.

The TOS 1.0 says (C) 1985, 86 in its info box. BlitterTOS mentions 1987 if
I remember it right. If you click on 'Hardcopy' in the DESKTOP menu, you
will get a safety alert box in BlitterTOS, but not in TOS 1.0. If you
worked with both versions, you'll also be able to detect the version just
from the speed of window redraw.

>I use DCFORMAT and have read other people having good results with IBMFMT (not
>sure of the spelling).

I've used DCFORMAT and the disks produced are readable by the MSDOS 3.3
PC's around here but none of them will write to the disks. I just copy the
boot sector (of a disk that has been formatted on a PC with MSDOS 3.3)
onto the newly ST desktop formatted disk (altering the serial number
of course). THis is the only way I've found that produces MSDOS 3.3
writable disks.

>Maybe the Gnu gcc with David B's "RTX" would do the trick.

Better sticking with minix and gcc. Yes minix is multi-tasking and gcc
tex, flex, yacc you name it everything is available for ST minix.
(Not PC though as the PC version has a limit of 64K for text and data
space 128K for big (?) processes). The ST is only limited by memory size.
OF course it's nice to have 4M as minix has no virtual memory, but
my 2.5M system is fine and my older 1M system is okay for one user.
You can have multiple logins via the rs232 and midi ports ;-)

From: zz1jm@sdcc4.ucsd.edu
Message-ID: <11038@sdcc6.ucsd.edu>
Source record: 240552

Howdy.

I've been scrounging through all my docs but I can't find any
reference to how to inquire and change the keyclick state. I don't
want to replace it, just shut it off.

I'd appreciate any pointers to some bios or xbios call I missed,
or whatever.

Oh yeah, thanks in advance!

4659. How to modify PageStream's Bookman "i" and "j" dots

Newsgroup: comp.sys.atari.st
Date: 1990-05-30 23:57:19 UTC
From: kibo@pawl16.pawl.rpi.edu
Message-ID: <TN|$3F@rpi.edu>
Source record: 240553

[]
I wanted to raise the dots on the "i" and "j" for clarity at
smaller sizes. Here's a way to do it...

I wrote this a few minutes before I discovered that the font
editor has just been released (posted to GEnie).

MODIFYING PAGESTREAM'S BOOKMAN "i" AND "j" DOTS

by James "Kibo" Parry 5/30/90
72347,2731 (Compuserve)
kibo@pawl.rpi.edu (Internet)
userfe0n at rpitsmts (Bitnet)

This file is an explanation of how to edit the PageStream "Bookman"
outline font (sold on font disk 3) to raise the "altitude" of the
dots on the lowercase "i" and "j". No font editor is needed--but you
need a DISK editor that will let you modify sectors in hexadecimal.

This editing will do nothing to the file except move those two
dots slightly--no character widths will be altered, or anything else.
DISCLAIMER: I am not responsible if you do strange things to the
disk with your disk editor (please follow the instructions below
very carefully.) I am not connected with the Soft-Logik company in
any way.

1.) Make a copy of BOOK.DMF. I suggest working from a copy made
from an unmodified version--if you have already edited BOOK.DMF,
the items you need to change below will be in different places.

2.) Start your disk editor. Tell it to open the BOOK.DMF file.
Note whether it calls the first sector of the file #0 or #1!

3.) Go to the 31st sector in the file (this will be #30 if your
editor calls the first sector #0.) Change your editor's
display mode from ASCII to HEX if you need to.

4.) Check to make sure the sector starts with "03 4E 00 04" and
ends with "02 8D 01 F5". If it doesn't, either your file is
different than my original BOOK.DMF, or else you're on the
wrong sector.

5.) Find the area in the sector that says "40 00 18 01 92" (it
starts at the 343rd byte in the sector). The "40" in
that region is the first number you will be changing. Here
are the changes you will be making in this sector:

```
ORIGINAL CHANGED (blank means no change)
40 00
00
18
01
92
01
F3 B3
02
06
01
F3 B3
02
06
02
40 00
00
18
02
06
02
8D 4D
01
92
02
8D 4D
01
92
02
40 00
```

6.) If you've done this right (and if I've done this right), you've just raised the dot on the "i" by 64 of PageStream's internal units. (The bytes we changed were the vertical coordinates. All that code was just for one little dot.) Now for the "j"...

7.) Near the end of the same sector--starting at byte #485--is a region that says "42 00 18 01 F5 01". We will start editing with the "42".

```
ORIGINAL CHANGED (blank means no change)
42 02
00
18
01
F5
01
F0 B0
02
69
01
```

```
F0 B0
02
69
02
42 02
00
18
02
69
02
8D 4D
01
F5
02
8D 4D
```

8.) The last byte you changed should have been two bytes away from
the last byte in the sector, if all went well. This sector
is finished and should be written to the disk.

9.) A little of the "j"'s data goes into the next sector, so
tell the disk editor to advance one sector. This sector
(the 32nd, or #31 in some editors) should begin with
"02 42 00 04".

10.) Change the "42" to "02" and write this sector to the disk.

You're now done. At this point, you should decide to do one
or the other of these:

A.) Delete the old version of BOOK.DMF from the disk you have
your fonts installed on, and put the new version in its place,

or

B.) If you want BOTH versions of Bookman installed in PageStream,
you should use the PageStream font converter to change the
name of the modified font and the ID number (this means keeping
a modified .FM for the new version, and possibly screen fonts
too.)

If you want to use this font on a Postscript printer that has the
"standard" Bookman built in, change the new version's name
and ID number and then create a downloadable .PS and .PSF font.

Let me know if you have any problems. I checked this document and
I hope that all the numbers are typed correctly.

It's a bit in the conterm system variable in protected memory at 0x484.

Here's a fairly paranoid program that turns it off.

```
#include <osbind.h>
main()
{
long ssp;
char conterm;
ssp = Super(0L); /* enter supervisor mode */
conterm = *(char *)0x484; /* get conterm */
Super(ssp); /* back to normal */
conterm = conterm & 0xFE; /* nuke the keyclick bit */
ssp = Super(0L); /* enter supervisor mode */
*(char *)0x484 = conterm; /* set conterm */
Super(ssp); /* back to normal again */
}
```

4662. Re: How is Atari doing in Europe?

Newsgroup: comp.sys.atari.st
Date: 1990-05-31 01:44:10 UTC
From: silos@bench.sublink.ORG
Message-ID: <456@bench.sublink.ORG>
Source record: 240556

I can say how Atari is doin' in Italy.
I'm a proud owner of a Mega ST 2 but i'm quite disappointed by
the marketing policy Atari Italy showed during last years.
Atari Italy is surely the subsidiary led in the closest way to the
US mother company.
Lack of advertising, when ads showed on newspapers and tv they were
futile, silly sometimes also wrong (PC advertized as ST etc).
In italy there has been a modest penetration of STs and Megas in the
market. Amigas share the most, along with a lot of low cost PCs like
Amstrad.
Sincerely today Atari has nothing to say nor in Italy, nor in the rest
of the world. They showed the wrong policy of squeezing the orange to get
the last drop of bucks, without investing enough time, people and money
in the development of a future for their products.
The St, and then the Mega were very good products. Now they are out of
date, slow and with limited expandibility.
Atari upgraded the TOS too slowly, there were and there are many bugs,
not compatible with a professional use. The lack of upward compatibility
with 68020/30, the too close architecture kept locked to video clk
frequencies and other amenities has killed the ST. Atari in Italy
was and is just for hackers... Why the Tramiel family, instead of producing
tons of vaporware and disillusion didn't give ST a real SCSI, a bug free
op sys, real expandability and a child, more powerfull to satisfy the
incoming needs of the new markets.
Atari in Italy is doing BAD....
Paolo.

>>030 will be out at the same time. Give Atari a chance.
>
>Cool! A date. ok so this Fall it will be out?.. I have heard rumours forever
>regarding its big show..

Just spoke to someone in the 'know' at Atari yesterday about the TT.

TT's this fall? Dunno, seems plausible.

As a real developer, we are on the list. I was told that it is being designed/
prepared for release in the US FIRST! And it is being readied for FCC approval.

Developers will be getting theirs soon. How soon? Soon...

If the US doesn't get it first, the US will at least get it at the same time
as the rest of the world...

Source record: 240568

In article <734@zinn.MV.COM> kgg@zinn.MV.COM (Kenn Goutal) writes:
[several comments about the use and functionality of different archivers]

ZOO is used a lot both here and in the PC newsgroups. Both it and LHARC support directory structures, which is a great help if you are sending a large package with source code, docs, etc.

In addition, both ZOO and LHARC support self-extracting archives, at least in the PC implementations. ZOO requires a supplementary program (SEZ), but LHARC does everything in one package.

My favourite all-around archiver is ZOO. The main reasons are:
Portability -- I can read the same archive under Unix, ST, PC.
Written in C, I can port it to other systems.
Directory support (as mentioned above).

However, for the PC alone I prefer LHARC, both for ease of building self-extracting archives and, above all, for superb compression. Almost always, LHARC writes the smallest archives. But I agree that it is not a great choice for a newsgroup, because of the portability problems. So I recommend that we use ZOO as much as possible, with ARC maintained for backwards compatibility.

>Ralph Mariano, and the staff of ST Report have recently obtained evidence th
>Greg Lindahl, who sends issues of ST Report and ZMag by E-Mail to several
>people on UseNet, has engaged in illegal activities concerning ST Report.

Personally, I'd suggest that Ralph read his own copyright notice
before he wets his pants. Through issue 418, his notice did not
require transmission without changes. Therefor, what I did is totally
legal, according to my understanding of copyright law.

I might note that my editing was confined to either deleting whole
sections or adding comments which were clearly labeled to be mine. I
don't know why Ralph doesn't like this other than the fact that my
comments about Ralph's mental state might not be how Ralph sees himself.

As of issue 419, his notice precludes modifying the magazine. Since it
is illegal for me to distribute ads over the Internet, the ST Report
mailing list is history. Goodbye Ralph, I won't miss you.

>Having been asked to post this message by Ralph Mariano (Publisher of ST
>Report), I also relay his request for dialogue with him on this matter....

I'm in the phonebook. But I don't answer my phone. Why don't you show
Ralph how to use the Compuserve-Internet gateway, and then he can
personally send me mail? I promise I'll print it out, frame it, and
put it on my wall. Lawsuit threats are always good for a laugh or two.

> I don't know if there's a difference between plain "Meg-a-Minute"
> and "Meg-a-Minute Elite", but the description of the latter in the

Meg-A-Minute Elite is just the latest version of the program.
It fixed a few bugs, added support for more than 4 partitions and made
the program a little less dependent on a single OS rev (the original
Twister format code needed access to some OS private floppy structures).
There were some other changes but since it was written close to 3 years
ago I don't remember any of them.

The name came from Dave and I deciding to follow Tom Hudson's
lead in program naming instead of just having a nice boring version 2.

Message-ID: <1990May31.182107.19302@msuinfo.cl.msu.edu>
Source record: 240569

I recently purchased an Epson LQ-510 24 pin printer and have been having problems printing screen dumps (ALT-HELP). Another problem is that I tried using a friends Publishing Partner ST (Color Version) and when it printed it never could put all the information on one page...by about an inch and a half.

Also I am looking to purchase a TOS upgrade and when I called I was told of a 2-chip Rainbow TOS. Is that from Atari? And I thought that it was made in six-chip format. I know there has been an ongoing discussion about the TOS upgrades and I am now sorry I didn't follow, but without stirring up to much fuss (maybe you could just respon by mail) could I get any opionions and suggestions as to what I should buy?

Thanx.

The question is where you would fit the ST into all of this. It seems that the only pieces of hardware that are NOT replaced are the keyboard, mouse, floppy, and video display (and of course you want 24-bit 1Kx1K, z-buffered graphics, no?). Seems like you are looking for a new computer.

-Jonathan

P.S. Keep the ST to run all of your old software. Even better, put it in a "compatibility" box. :-)

I heared about some serious bugs, especially in the debugger.
What about them? How is support? I think I'll wait a bit for
the code and use my Prospero-C. Support is like DEC.

CU Carsten.

Does anyone have a Zmodem Sender for Atari ST that sends the file as
a stream (the one I have wait for ACK for each block and my own Ymodem is
faster than that version :-) All the other Zmodems on other systems send
data as a long stream and does not wait for control-packages !!!

A freind of mine has been asking me about Specter. His buisness wants to install Mac's to do their publishing. However, beset with a shortage of funds they would like to know if installing Atari's with the Specter board and software is a good idea.

Some questions:
How compatible does this make the Atari to the Mac?
Will this package continue to be supported?
How stable is the company that produces this package?
Does it run Mac programs slower than Mac?

I would appreciate your comments.

Sincerely,
Bill Johnston

TT will be presented to the press here in Holland at june 7th, at
Atari office. Production starts same month in Taiwan. First machines
will be flown in end of month. Regular sales in August, that is: in
Holland. First machines ofcourse are handmade models. Regular
shipments are massproduction. Price is not coming down before fall.
